Analisis Penambatan dan Gerakan pada Dok Apung akibat Gaya-Gaya Luar dengan Variasi Konfigurasi Pengikatan pada Perairan Dangkal Terbatas

Fajar Adi Pratama

Dosen Pembimbing :

Prof. Ir. I Ketut Aria Pria Utama, M.Sc, Ph.D

Teguh Putranto, ST, MT

Latar Belakang :

Grafik Harga

Berikut adalah grafik harga properti yang terdaftar di UrbanIndo untuk daerah Surabaya, Jawa Timur

Current Summary

| Properti | Rumah | Tanah | Apartemen |
|-----------------------|-----------------------|-----------------------|-----------------------|
| Rata-rata: Rp. 6,94jt | Rata-rata: Rp. 6,82jt | Rata-rata: Rp. 4,68jt | Rata-rata: Rp. 12,0jt |
| Median: Rp. 6,2jt | Median: Rp. 6jt | Median: Rp. 3,5jt | Median: Rp. 10,6jt |

DIAGRAM ALIR ⁽¹⁾ :

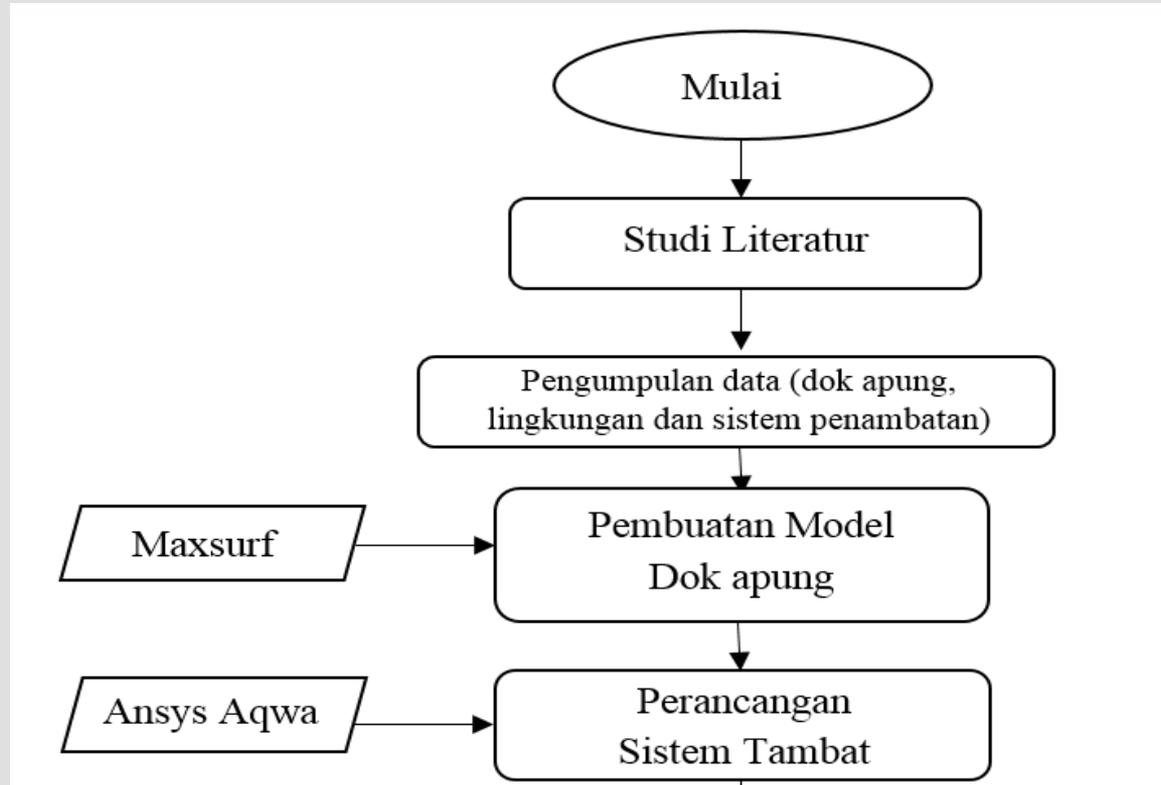

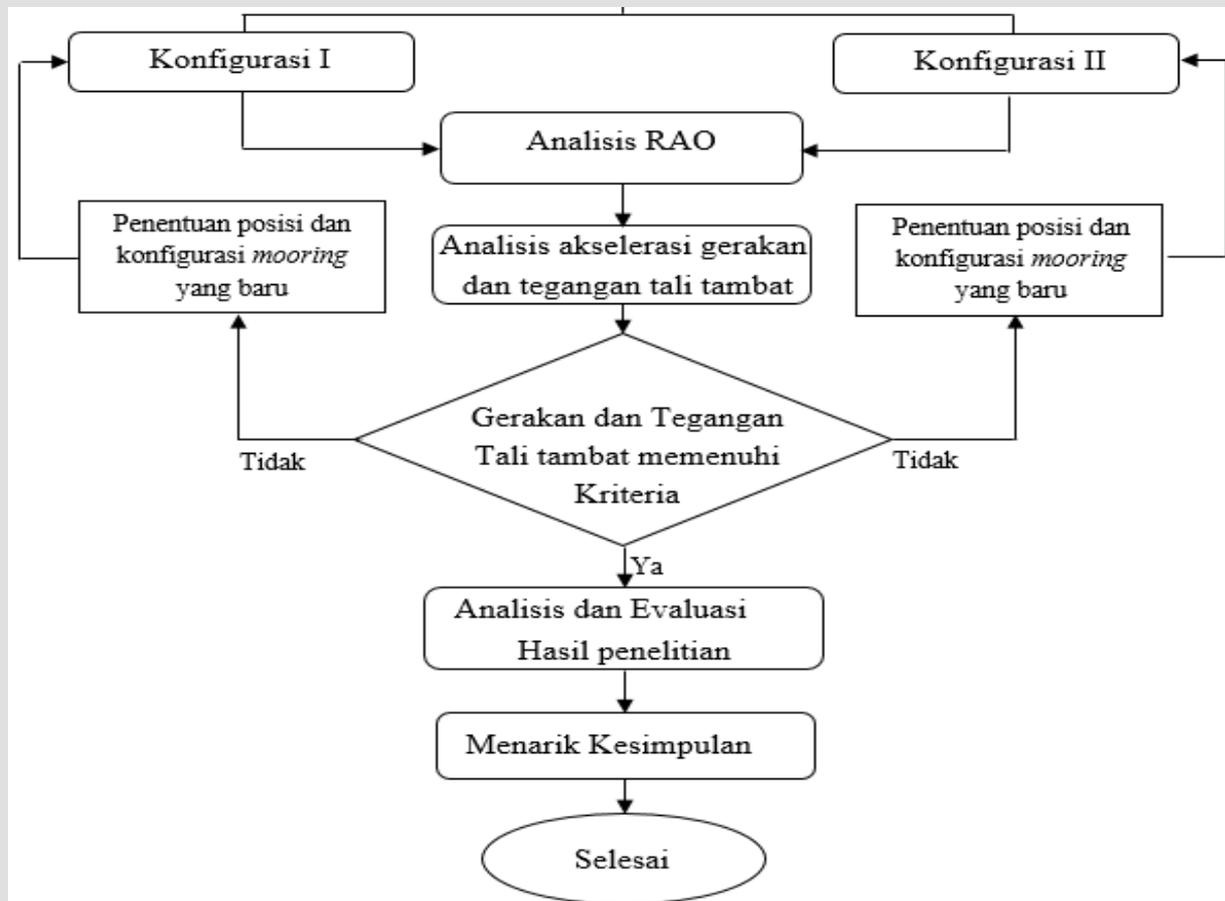

DIAGRAM ALIR (2) :

Perumusan Masalah :

- 1) Bagaimanakah sistem tambat yang aman dan nyaman untuk dok apung pada kondisi perairan dangkal dan terbatas;
- 2) Bagaimanakah perangkat lunak memberikan representasi untuk analisis penambatan dan gerakan;
- 3) Berapakah nilai *tension* dari sistem tambat untuk dok apung pada kondisi perairan dangkal dan terbatas;
- 4) Bagaimanakah gerakan (perpindahan dan akselerasi) yang terjadi pada desain sistem penambatan yang telah direncanakan.

Tujuan :

- 1) Memberikan hasil berupa representasi nilai dan grafik antara durasi terhadap posisi dari dok apung (*time domain*);
- 2) Menghadirkan gerakan dalam bentuk visualisasi 3D dari desain sistem penambatan dok apung terhadap perilaku gaya-gaya eksternal;
- 3) Melakukan analisis penambatan terhadap struktur sistem penambatan dok apung dengan perangkat lunak Ansys Aqwa;
- 4) Melakukan analisis gerakan (perpindahan dan akselerasi) dalam 6 derajat kebebasan terhadap struktur sistem penambatan dok apung dengan perangkat lunak *Ansys Aqwa*.

Data Terkumpul :

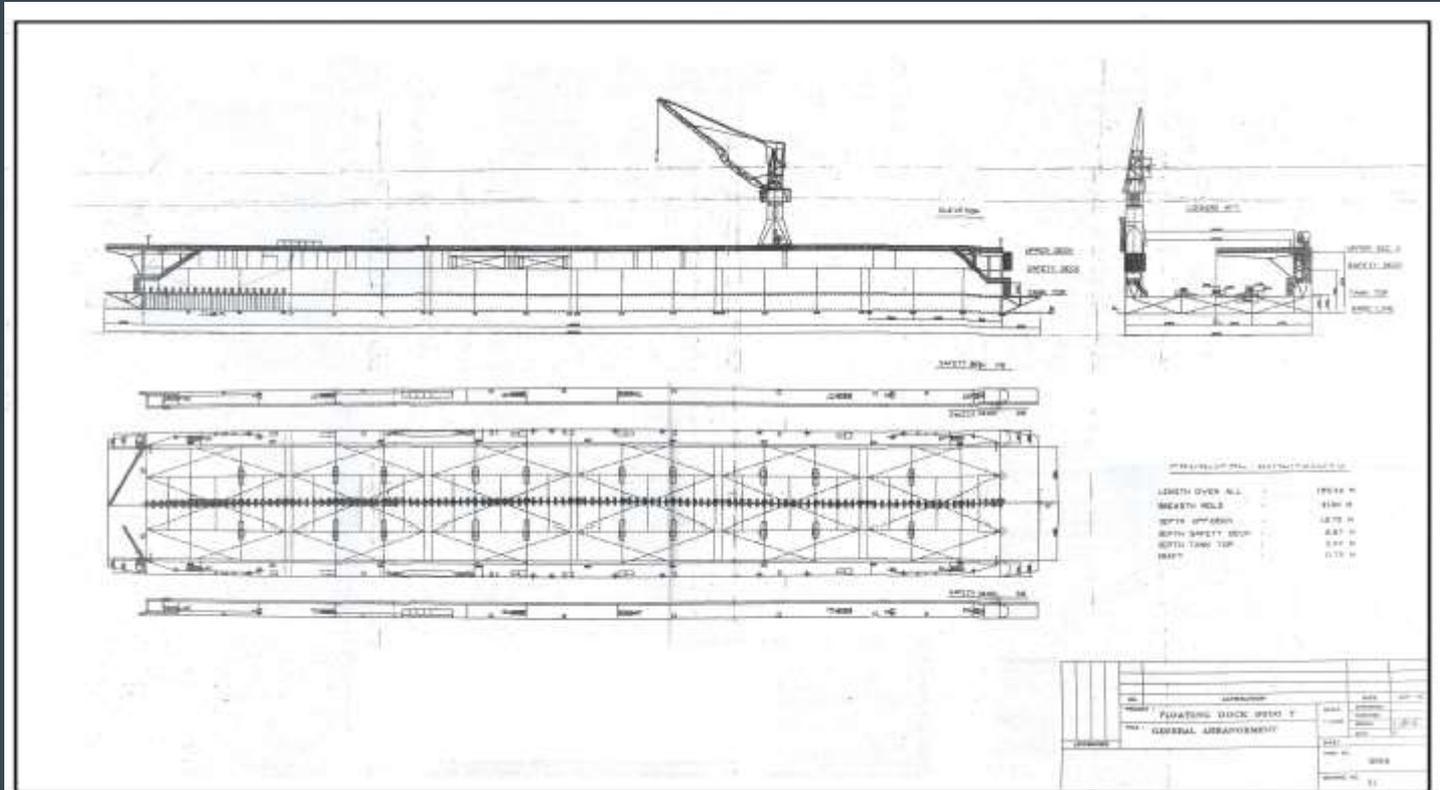

❖ Data Dok Apung :

- General Arrangement, - Kondisi Pemuatan, - Data rantai *Mooring*

❖ Data Lingkungan :

- Batimetri, - Data Arus, - Data Angin, dan Gelombang

General Arrangement :

Kondisi Operasi :

Kondisi Pemuatan :

| Kondisi <i>Floating Dock</i> | <i>Displacement</i> (ton) | Sarat (m) |
|------------------------------|---------------------------|-----------|
| Kosong (tanpa muatan) | 5672 | 1,25 |
| <i>Docked Ship</i> | 10436 | 2,3 |
| <i>Ballast</i> | 20421 | 9 |

| | |
|--|---------|
| Radius Girasi <i>Floating Dock</i> Sumbu X | 12,0856 |
| Radius Girasi <i>Floating Dock</i> Sumbu Y | 41,5461 |
| Radius Girasi <i>Floating Dock</i> Sumbu Z | 42,6453 |

Pemodelan Floating Dock :

❖ Pemodelan Maxsurf :

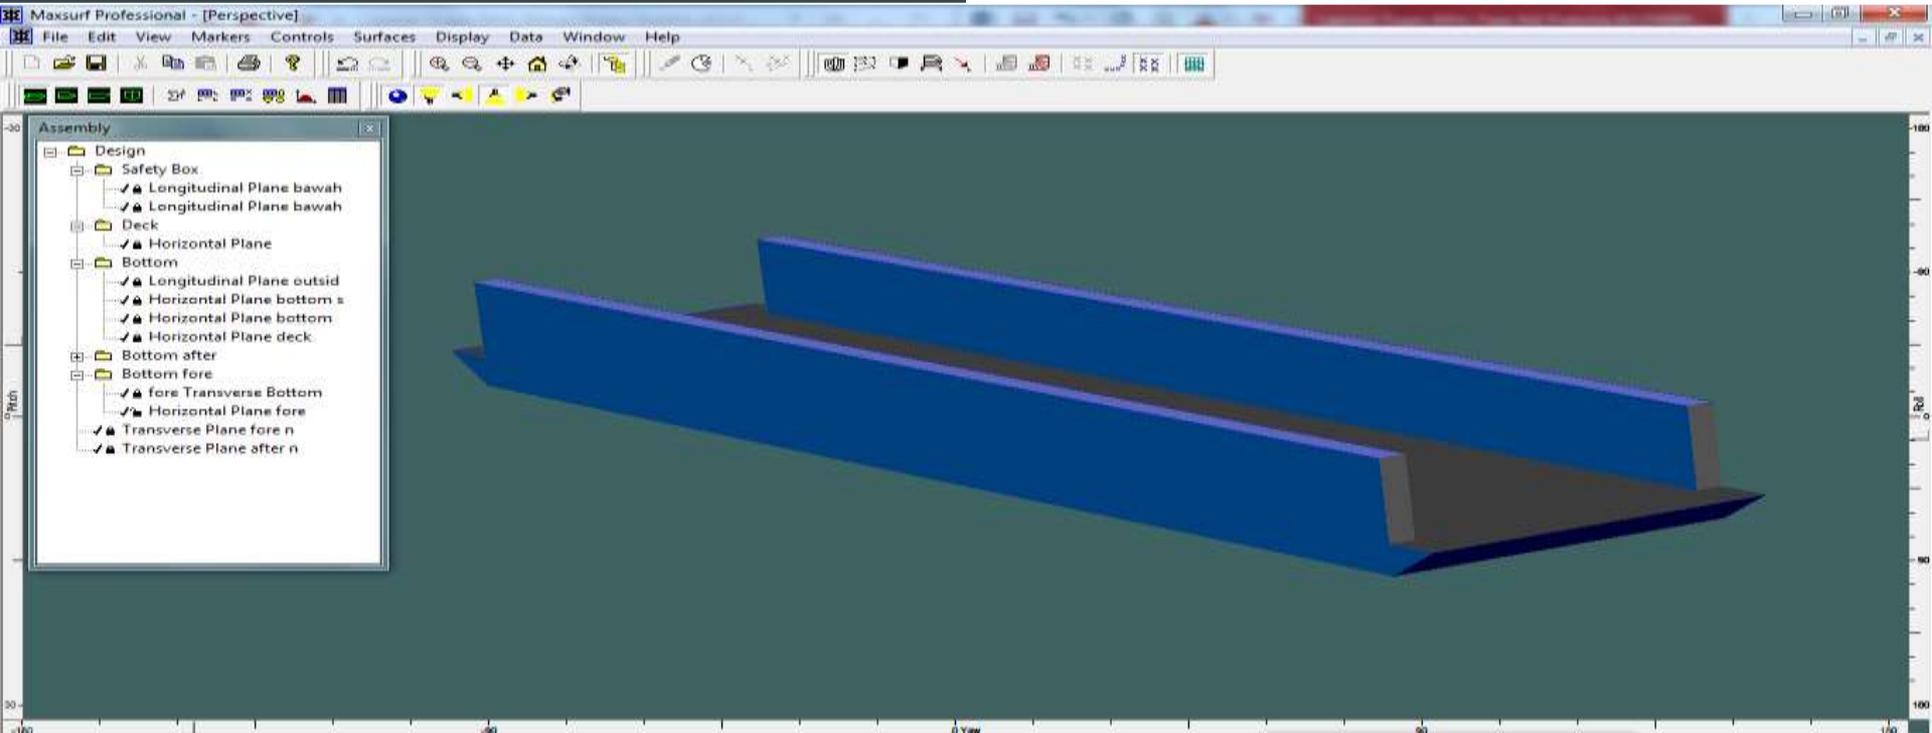

- kondisi pemuatan

❖ Pemodelan Ansys Aqwa :

- Dermaga, - Kondisi Lingkungan, - Kondisi Pemuatan, - Konfigurasi Tali Penambatan,

Maxsurf Model

Pemodelan Floating Dock melalui Software Maxsurf pada tiap-tiap kondisi pemuatan

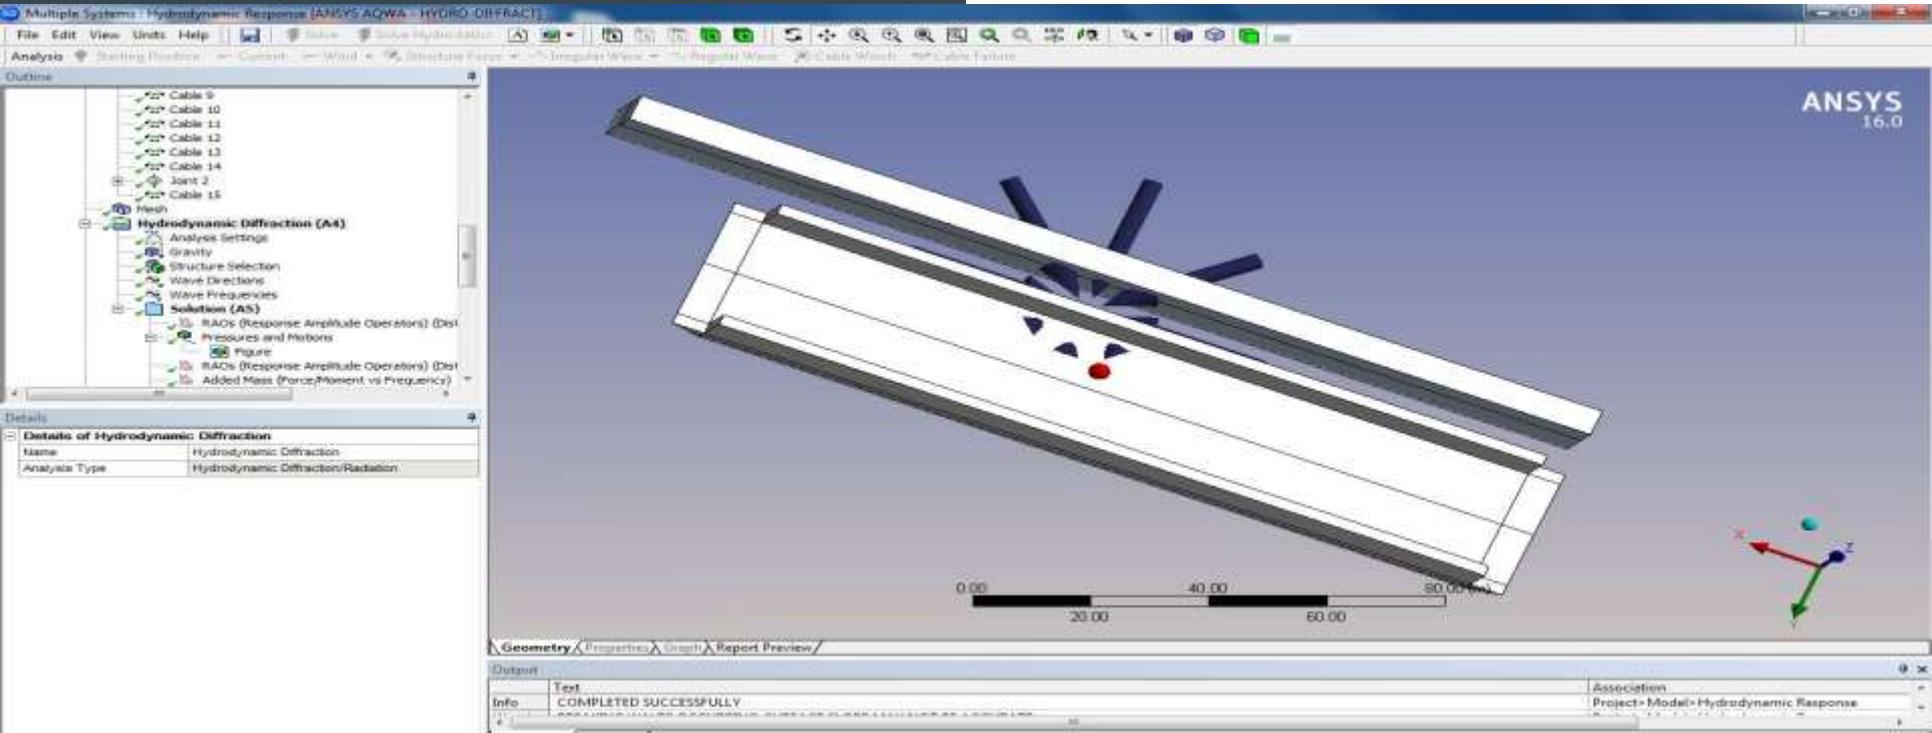

Validasi Model

Hasil pemodelan melalui *software* maxsurf telah memenuhi kriteria, sehingga layak untuk digunakan.

| | Unit | Data | Hasil Pemodelan | Kriteria | |
|-------------|------|------|-----------------|----------|------------|
| | | | | ABS | Keterangan |
| Displasemen | ton | 5672 | 5747 | < 2% | OK |
| Sarat | m | 1,25 | 1,25 | < 1% | OK |

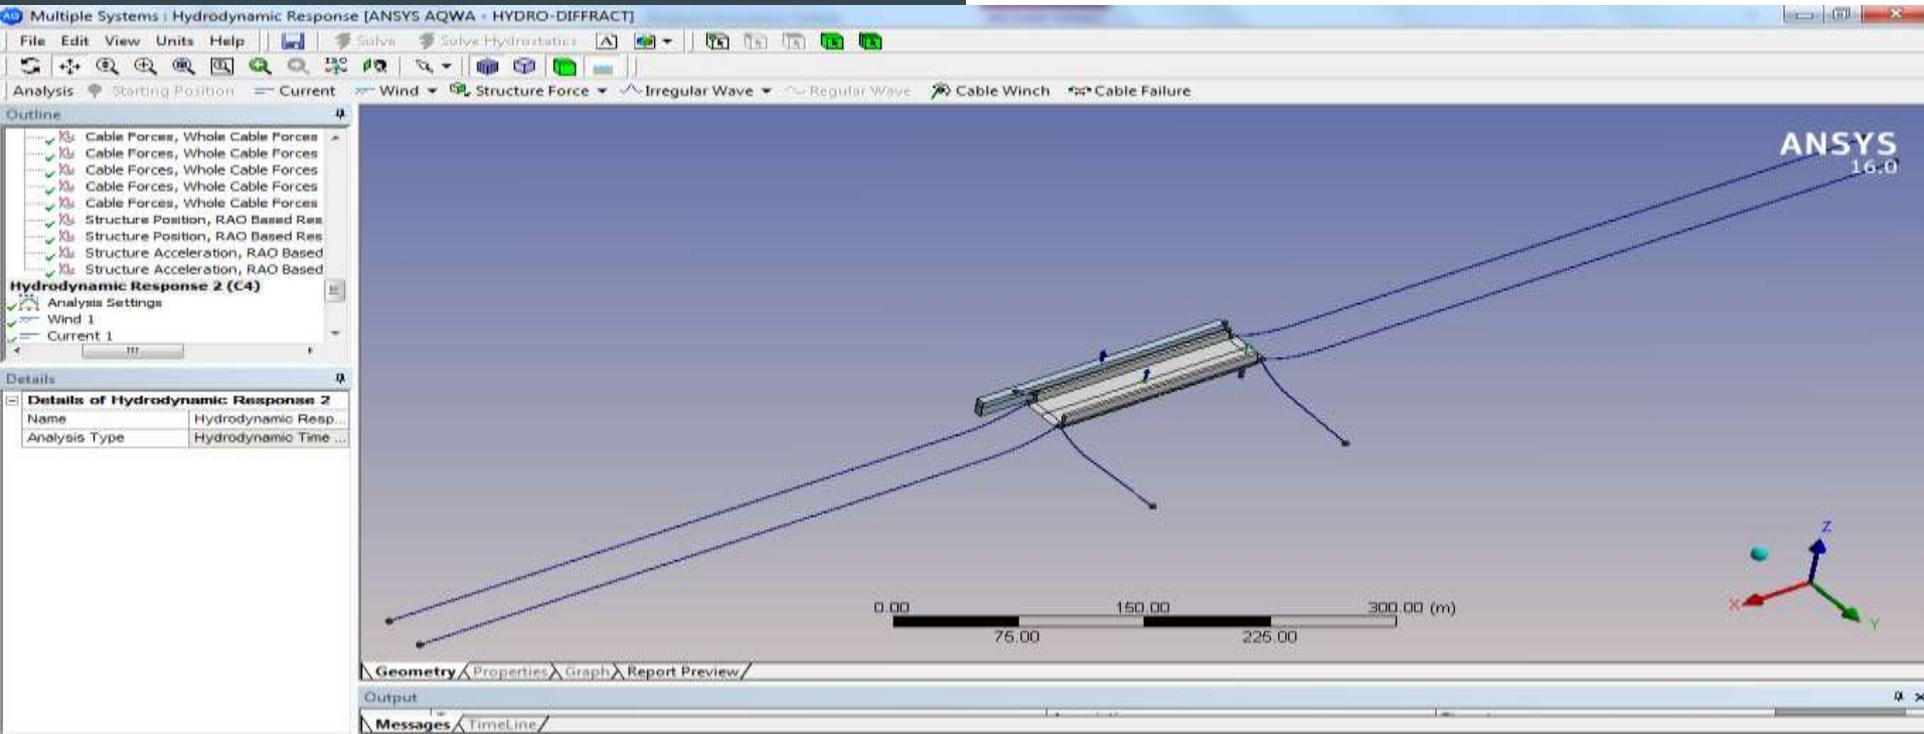

Ansys Model

Pemodelan Dermaga/*Pier* melalui software Ansys Aqwa

Ansys Model

Instalasi Tali Tambat Dok Apung *On shore* dan *In shore* Konfigurasi I

Ansys Model

Instalasi Tali Penambatan Dok Apung *On shore* dan *In shore* Konfigurasi II

ANSYS 16.0

Analisis Hasil Pemodelan :

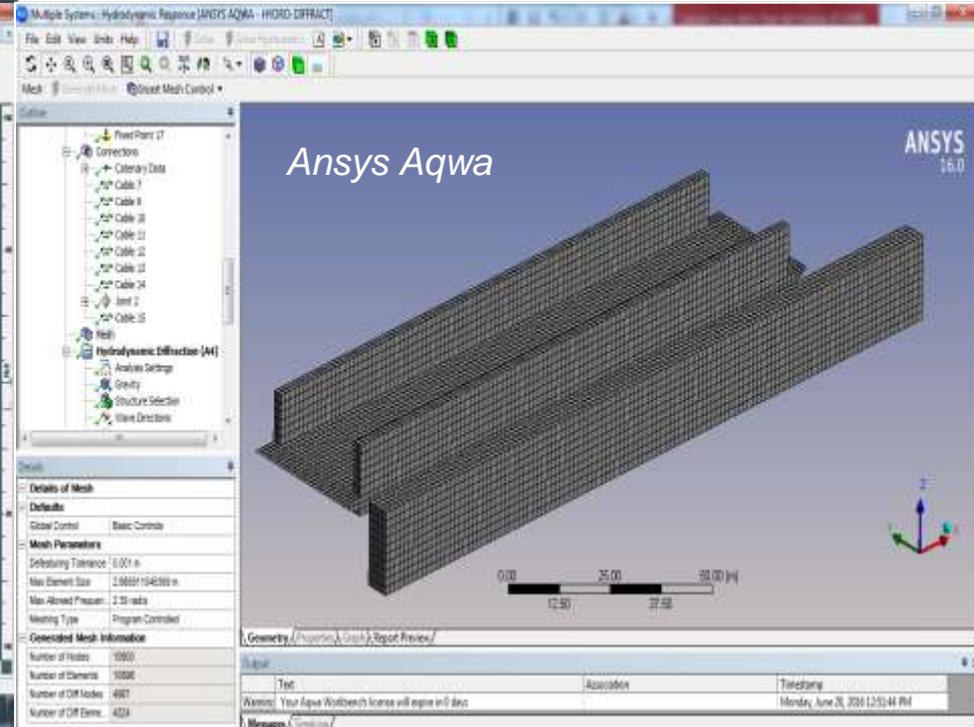

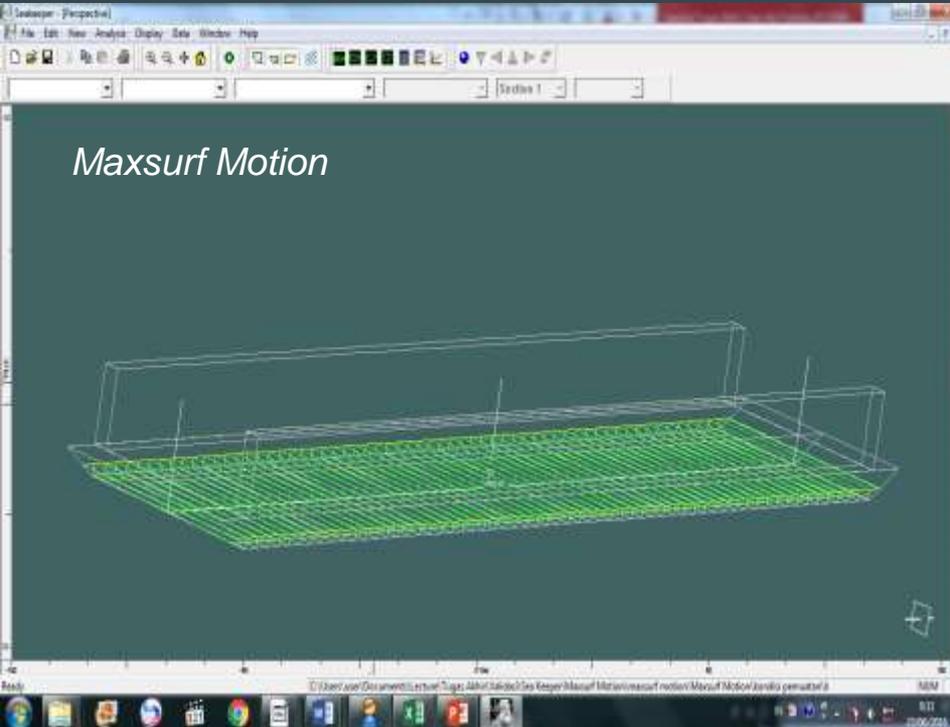

❖ Ansys Aqwa :

- Konvergensi *Meshing*

- *Bank Effect*, - (RAOs), - Perpindahan dan rotasi, - *mooring tension*

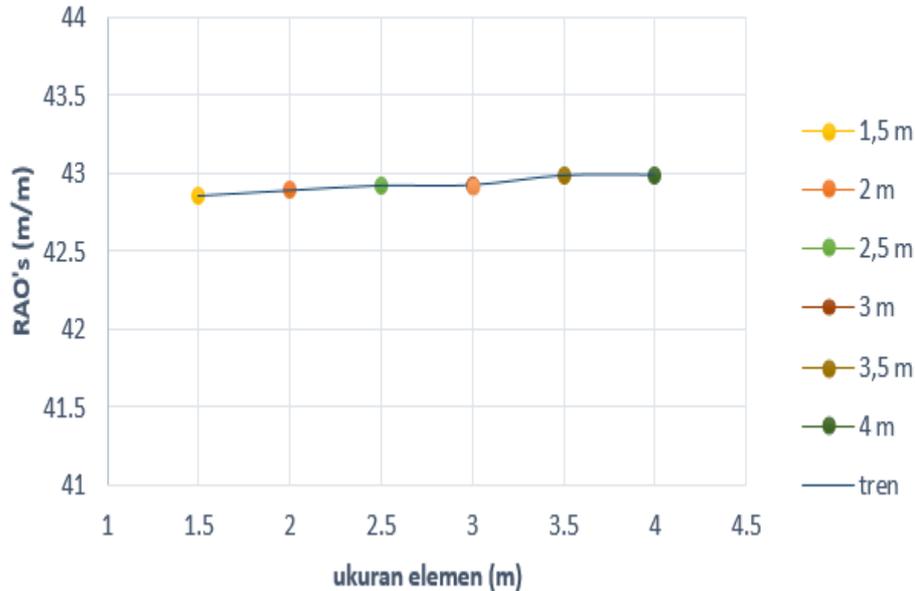

Teori Analisis

Strip Theory Vs 3D Diffraction

KONVERGENSI MESH

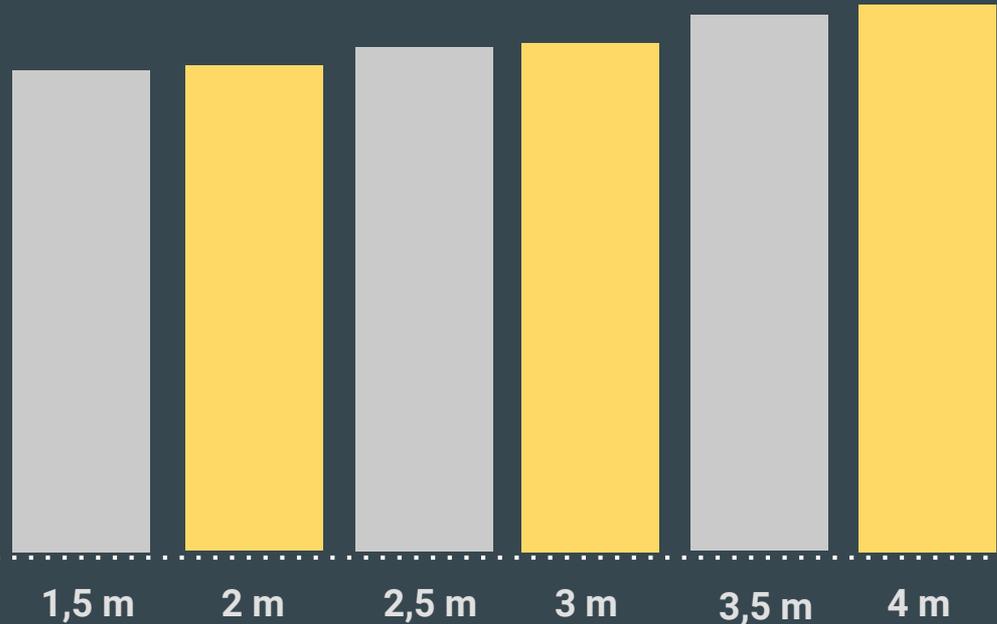

Konvergensi Hasil

Perbandingan nilai RAO (*Surge*) dari beberapa besaran *mesh size*. Analisis dari beberapa *mesh size* menghasilkan nilai yang saling berhimpitan. Semakin kecil nilai mesh size akan menghasilkan nilai ketelitian yang semakin tinggi. Untuk mengetahui nilai konvergen minimal variasi ukuran pada konvergensi *meshing* sebanyak 5 (Logan, 2007)

PENENTUAN UKURAN MESH

Selisih dari luas area di bawah kurva sangat kecil dengan rata-rata selisih luas antar ukuran mesh hanya sebesar 0,1 % dan hanya terdapat satu tren yang terjadi pada grafik (tren naik). Konsistensi tersebut menandakan bahwa tingkat *error* sangat kecil dalam proses meshing hingga *running*

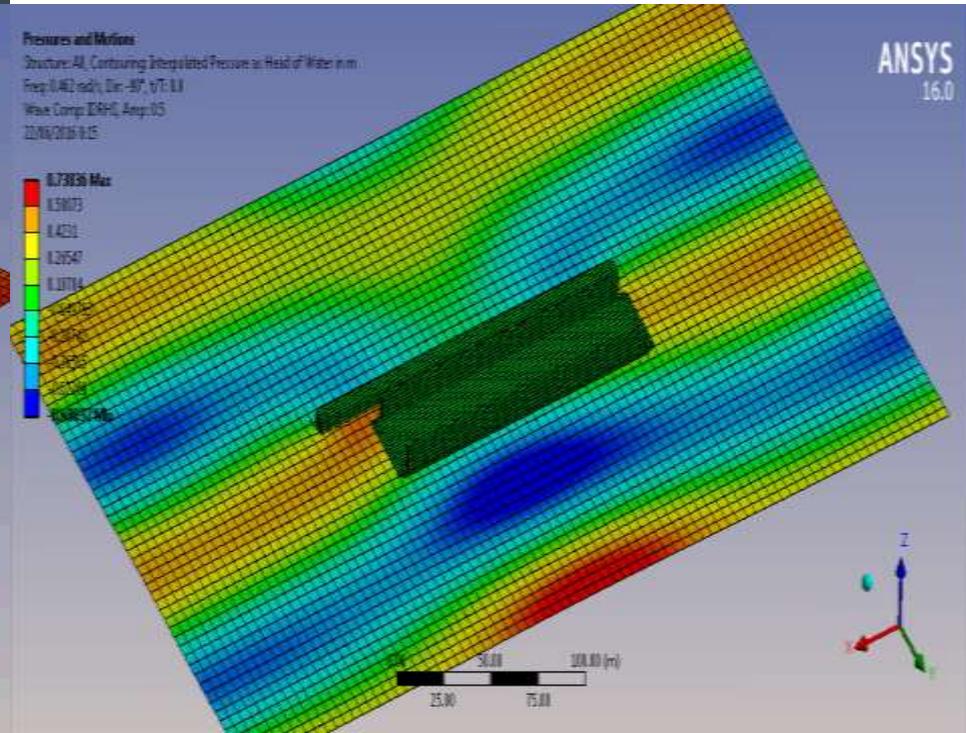

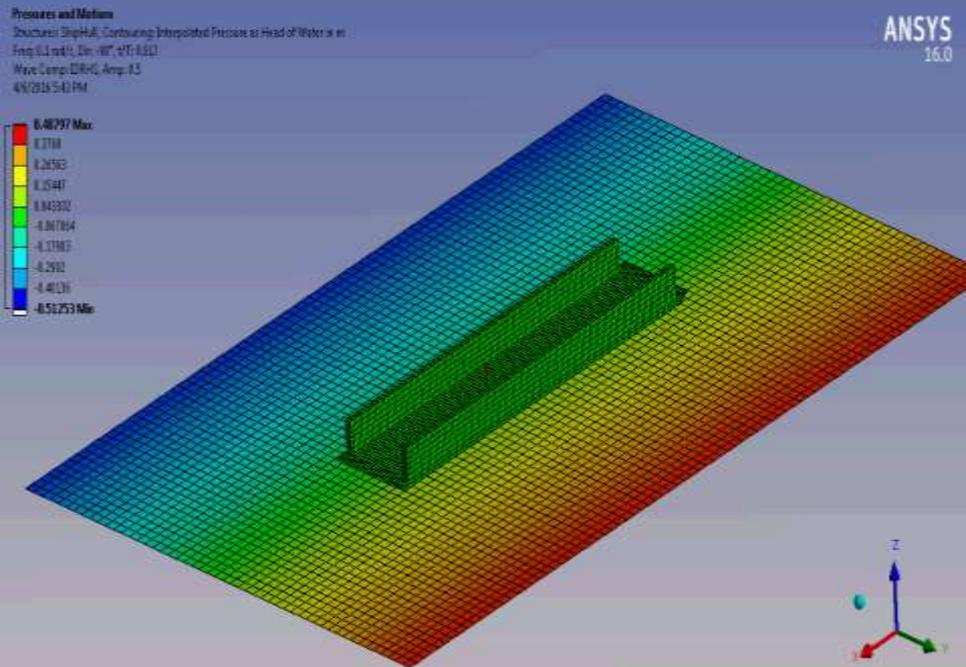

PENENTUAN UKURAN MESH

Maksimal pembagian jumlah elemen dalam Ansys Aqwa sebanyak 40000 elemen dan lama waktu proses running bergantung pada spesifikasi komputer. Berdasarkan tingkat ketelitian dan lama waktu komputer dalam melakukan perhitungan numerik, maka dipilih mesh dengan ukuran 2,5 m dalam melakukan analisis untuk kedepannya.

| Grid | Mesh Size | Total Elemen | Jumlah Node | Lama Running |
|------|-----------|--------------|-------------|--------------|
| 1 | 4 m | 4698 | 4700 | 15 menit |
| 2 | 3,5 m | 6706 | 6710 | 25 menit |
| 3 | 3 m | 8812 | 8816 | 45 menit |
| 4 | 2,5 m | 10896 | 10900 | 70 menit |
| 5 | 2 m | 17378 | 17382 | 140 menit |
| 6 | 1,5 m | 31294 | 31298 | 330 menit |

Bank Effect

Perbandingan gerakan *Floating Dock*, tanpa dan dengan Dermaga untuk mengetahui *bank effect*

Bank Effect

Selisih terbesar perpindahan (*surge*) pada gelombang frekwensi 0.34 rad/s dan arah -45°

RAOs (Response Amplitude Operators) *Floating Dock* tanpa Dermaga

MOORING

Instalasi sitem penambatan menggunakan 2 komponen: rantai dan *wire rope*.

MOORING TENSION KRITERIA

| Konfigurasi: | Kondisi: | Jenis: | Tegangan (N): | Kriteria (API): |
|----------------|---------------|-----------|---------------|-----------------|
| Konfigurasi I | Muatan Kosong | Rantai | 794128.1 | ✓ |
| | | Wire rope | 1415262 | x |
| | Muatan Kapal | Rantai | 1603832 | ✓ |
| | | Wire Rope | 1419582 | x |
| Konfigurasi II | Muatan Kosong | Rantai | 1172172 | ✓ |
| | | Wire Rope | 1415234 | x |
| | Muatan Kapal | Rantai | 1349754 | ✓ |
| | | Wire Rope | 1419580 | X |

Safety Factor pada tension maksimal yang terjadi pada tali penambatan dok apung mengacu pada API RP 2SK ^{2nd} *editon*, sebesar 1, 67 dengan persamaan

$$Safety\ Factor = \frac{Minimum\ Breaking\ Load}{Maximum\ Tension}$$

Terindikasi bahwa pada penambatan kondisi *ballast* (9m) kurang aman atau tidak memenuhi kriteria.

Validasi Hasil :

Kesimpulan

Dalam pengerjaan tugas akhir dapat dihasilkan beberapa kesimpulan yang menjawab tujuan permasalahan

1. Gerakan yang terjadi baik berupa perpindahan, rotasi maupun akselerasi didominasi oleh gaya eksternal kolinier -90°
2. Tegangan (*tension*) paling tinggi dialami rantai oleh dok apung saat gaya eksternal dengan arah kolinier -90°
3. Konfigurasi penambatan II lebih efektif dibandingkan konfigurasi penambatan I, ditinjau dari gerakan maupun tegangan pada tali tambat model dok apung
4. Terdapat suatu efek (*Bank effect*) pada dok apung akibat interaksi dengan dermaga, dan juga pada kondisi muatan balas penuh terdapat suatu efek (*squat effect*) yang menyebabkan gerakan kapal mengalami perubahan
5. Penggunaan tali penambatan *wire rope* dibutuhkan spesifikasi yang lebih tinggi dibanding dengan perencanaan sebelumnya, sebab dalam kondisi ekstrim nilai ketahanan tali tidak sesuai dengan kriteria API

TERIMA KASIH
