SURABAYA, 12 FEBRUARI 2009

Analisa Stabilitas Dinamis Sistem Barge dan Jacket Saat Peluncuran

Nama Mahasiswa : Dhani Fayumi Asyhar
NRP : 4303 100 014
Jurusan : Teknik Kelautan FTK – ITS
Dosen Pembimbing : Dr.Ir.Wisnu Wardhana, M.Sc.
Prof. Ir. Paulus Indiyono, M.Sc, Ph.D

Abstrak

Tugas akhir ini membahas tentang stabilitas *barge* pada saat *launching jacket* dan *stress distribution* yang dialami *rocker arm* akibat pergerakan *jacket* dan *barge*. *Launching* merupakan salah satu cara instalasi struktur *jacket* yang beratnya melebihi kapasitas angkat dari *crane barge*. *Cargo barge* di-*ballast* atau di-*trim* sampai posisi kemiringan tertentu dan pengikat (*sea-fastening*) dipotong, sehingga *Jacket* meluncur dari *barge* ke air dengan sendirinya akibat pengaruh gaya gravitasi. Selanjutnya struktur *jacket* terapung dengan sendirinya karena *bouyancy*-nya sendiri atau dengan *floatation tank* sementara. *Barge* yang digunakan adalah *barge* S45 milik PT. SAIPEM Indonesia, dengan dimensi 180 x 42 x11.5 dan berat total 15700 tons. Dan *Jacket* yang dilaunching adalah The LD22-1 CEP *jacket* yang mempunyai delapan kaki dan 12 *skirt piles*. Estimasi berat *jacket* adalah 4259.3 metric ton. Kecepatan maksimum *jacket* pada waktu peluncuran adalah 6,16 m/s. Dan bottom clearance yang dialami *jacket* adalah 52,4 m dengan dalam perairan 93,5 m, sehingga dapat di ambil kesimpulan bahwa *jacket* masih aman setelah berosilasi bebas. Kendala yang diperhatikan adalah kondisi lingkungan, yaitu angin dan gelombang. Untuk tinggi gelombang 0,5 meter dan kecepatan angin 50 knot pada simulasi launching 80 detik (dimana pada saat *jacket* mengalami *tipping*), maka di dapatkan harga *righting lever GZ* sebesar 3,89 meter, hal ini menunjukkan bahwa *barge* masih dalam keadaan stabil selama *launching jacket*. Gaya pada *rocker arm* pada saat *jacket* mengalami *tipping* yaitu adalah sebesar 2090 m-ton untuk *rocker arm* pada sisi portside dan 2142 m-ton untuk *rocker arm* pada sisi starboard. Total gaya yang di terima *rocker arm* adalah 99% dari keseluruhan berat *jacket*.

Kata kunci : launching *Jacket*, stabilitas, righting lever GZ, strees distribution, rocker arm.

Dinamic Stability Analysis Barge and Jacket system during Launching

Name	: Dhani Fayumi Asyhar

Abstract

This final task is concerning about stability of barge while launching jacket and concerning stress distribution on rocker arm that effected by motion of jacket and barge. Launching is one of many several ways installing jacket which jacket's weight exceed the capacities lift from crane barge. Cargo barge is ballasted until inclination position shall selected and sea-fastening being cut, so that Jacket glide from barge to water by itself effect of influence gravitation. Then jacket is floating by its bouyancy or flotation tank. Barge the used is barge S45, property of PT. SAIPEM INDONESIA, with dimension of 180 x 42 x11.5 and heavily totalize 15700 tons. And the jacket is LD22-1 CEP jacket which has eight legs and twelve skirt piles. It is to be installed in 93.5 meters of water in South China Sea. The estimated jacket weight is 4259.3 metric tonnes. Modeling and loading simulation was performed using MOSES software. Maximum speed jacket when launching is 6,16 m/s. And bottom clearance of jacket is 52,4 with in water deep of 93,5 m, so that can in taking conclusion that jacket is safe after free osilated. Constraint the paid attention is environmental condition, that is wave and wind. 0,5 m wave height and 50 knot wind velocity for launching simulation 80 seconds, (where jacket tips), hence in getting the righting lever (GZ) equal to 3,89 m, this matter indicate that barge still in a state of stabilizing during launching jacket. The maximum rocker arm reactions occur when the jacket tips. Each rocker beam takes about 2090 metric tonnes of load for portside and 2142 metric tonnes of load for starboard. The total reaction for both port and starboard is about 4232 metric tones or 99% of jacket weight.

Keywords : launching Jacket, stability, righting lever , strees distribution, rocker arm.

KATA PENGANTAR

Assalamu'alaikum Wr. Wb.

Alhamdulillah puji syukur penulis panjatkan kehadiran Allah SWT atas segala limpahan rahmat, hidayah dan karunia-Nya, sehingga penulis dapat menyelesaikan Tugas Akhir ini dengan dengan baik dan lancar. Tugas Akhir ini berjudul "**Analisa Stabilitas Dinamis Sistem Barge dan Jacket Saat Peluncuran**".

Tugas Akhir ini disusun guna memenuhi persyaratan dalam menyelesaikan Studi Kesarjanaan (S-1) di Jurusan Teknik Kelautan, Fakultas Teknologi Kelautan (FTK), Institut Teknologi Sepuluh Nopember Surabaya (ITS).

Kami menyadari dalam penulisan laporan ini masih banyak kekurangan, oleh karena itu saran dan kritik sangat penulis harapkan sebagai bahan penyempurnaan laporan selanjutnya. Penulis berharap semoga laporan ini bermanfaat bagi perkembangan teknologi di bidang rekayasa kelautan, bagi pembaca umumnya dan penulis pada khususnya.

Wassalamualaikum Wr. Wb.

Surabaya, 12 Februari 2009

UCAPAN TERIMA KASIH

Adalah sebuah hal yang mustahil dan tidak mungkin terjadi, jika dalam menyelesaikan Tugas Akhir ini penulis tidak mendapat bantuan serta dukungan dari berbagai pihak. Maka sepantasnya pada kesempatan yang begitu baik ini, penulis mengucapkan terima kasih yang sebesar-besarnya kepada Ayahanda Askuri dan Ibunda Siti Aliyah yang telah mendukung dan membiayai pendidikan selama ini serta Adikku Mimi. Bapak Dr.Ir.Wisnu Wardhana, M.Sc. dan Bapak Prof. Ir. Paulus Indiyono, M.Sc, Ph.D selaku dosen pembimbing yang selalu dengan sabar menyediakan waktu memberikan bimbingan dan arahan selama pengerjaan Tugas Akhir ini. Kepada Bapak Ir. murdjito, M.Sc,Eng dan Bapak Dr. Ir. Mahmud Mustain, M.Sc. selaku Kajur dan Sekjur Teknik Kelautan serta kepada semua Bapak dosen Jurusan Teknik Kelautan atas semua bimbingan dan ilmunya. Kepada bapak Ir. Arief Suroso, M.sc. selaku dosen wali yang selalu memberikan pengarahan. Semoga bimbingan yang bapak dan ibu berikan dicatat sebagai amal ibadah oleh Allah SWT.

Tidak lupa terima kasih buat pegawai TU jurusan Teknik Kelautan, bagian kemahasiswaan Dekanat dan BAAK yang telah mengurus semua administrasi penulis selama kuliah. Juga terima kasih banyak buat temen-temen Lab. Hidrodinamika dan Puslit, temen-temen seperjuangan TA Dono, Mirza, fak-fak, Agus (jimbon), Deni (contong), Ace, feri batak dan temen-temen Kontrakkan IIIc/62 dan PEM (Petrolifiere En Mere), keluarga besar PCI crews, dapid makisang yang memberikan arahan dan sarannya. Erry dan keluarga yang telah memberikan supportnya. Semua warga Kelautan dan *my special friend* yang selalu memberi semangat serta semua pihak yang tidak bisa penulis sebutkan. Terima kasih banyak, semoga mendapat balasan pahala dari Allah SWT.

BAB I

PENDAHULUAN

1.1 Latar Belakang Masalah

Dengan semakin terbatasnya cadangan minyak dan gas bumi di daratan, maka eksplorasi minyak dan gas bumi pada saat ini telah menghasilkan perkembangan pada proyek pengeboran minyak dan gas lepas pantai (*offshore drilling*). Dengan semakin berkembangnya dan majunya teknologi yang ada maka peralatan yang berkaitan dengan *offshore* pun akan semakin canggih dan semakin modern.

Jacket merupakan salah satu struktur *fixed* atau anjungan terpanjang yang biasa digunakan untuk proyek pengeboran minyak dan gas untuk perairan dangkal yang mempunyai kedalaman tidak lebih dari 200 meter.

Platform structures telah banyak digunakan untuk berbagai proyek *offshore* seperti pengeboran, pemrosesan hidrokarbon dan *support* operasi *offshore*. Tipe struktur *jacket* sesuai untuk perairan dangkal, hal ini dikarenakan kestabilan *jacket* karena terpanjang ke dasar laut dan beban dinamis (angin, gelombang dan arus) yang relatif tidak besar pada perairan yang dangkal. Ukuran *jacket* tergantung dari ukuran dek yang akan dioperasikan di atas struktur *jacket*, dimensi dari pondasi, dan beban lingkungan. Untuk mendapatkan hasil yang maksimal, beberapa analisa penting seperti analisa *in-place*, analisa *fatigue*, analisa *dynamic*, analisa *load-out*, analisa *transportation*, analisa *lifting* dan analisa *launching* harus dilakukan.

Karena dimensi *jacket* yang besar, teknik *launching* digunakan untuk meng-*install jacket* pada lokasi yang telah ditentukan. Analisa *launching* harus mempertimbangkan beberapa parameter yang berpengaruh, seperti kondisi laut, spesifikasi *cargo barge*, *ballast*, *trim angle*, stabilitas *barge*, stabilitas *jacket*, dan lain-lain.

Karena *launching* merupakan suatu proses yang penting dan kompleks, maka perhitungan akan aspek-aspek diatas harus benar-benar dilakukan. Hasil dari perhitungan parameter diatas disajikan dalam *numerical modelling*.

Kombinasi stabilitas dinamis *barge/jacket* merupakan hal yang patut diperhatikan saat *launching* disamping faktor-faktor yang lain, karena Stabilitas *barge* sangat mempengaruhi kelancaran proses *launching*.

1.2 Perumusan Masalah

Permasalahan dari tugas akhir ini adalah :

1. Bagaimana pengaruh perbedaan ketinggian gelombang dan kecepatan angin terhadap Stabilitas sistem *barge* dan *jacket* pada saat *launching*.
2. Bagaimana pergerakan, perubahan kecepatan dan *bottom clearance* yang dialami *barge* dan *jacket* selama proses *launching*.
3. Bagaimana *Dynamics stress distribution* yang dialami *rocker arm* akibat pergerakan *jacket* pada waktu *launching*.

1.3 Tujuan Penelitian

Dari perumusan masalah diatas, dapat diambil tujuan yang ingin dicapai dalam tugas akhir ini adalah :

1. Mengetahui pengaruh perbedaan ketinggian gelombang dan kecepatan angin terhadap Stabilitas sistem *barge* pada saat *launching*.
2. Mengetahui pergerakan, kecepatan dan *bottom clearance* yang dialami *barge* dan *jacket* pada waktu *launching*.
3. Mengetahui *stress distribution* yang dialami *rocker arm* akibat pergerakan *jacket* pada waktu *launching*.

1.4 Manfaat Penelitian

Sebagai bahan kajian dan suatu acuan terhadap proses instalasi *jacket* menggunakan cara *launching* dengan mempertimbangkan tinggi gelombang dan kecepatan angin yang terjadi. Dan juga untuk mengetahui *bottom clearance*, *motion*, dan perubahan kecepatan *barge* dan *jacket* selama proses *launching* dilakukan. Dan juga untuk mengetahui *stress distribution* yang dialami *rocker arm* akibat pergerakan dinamis *jacket* dan *barge*.

1.5 Ruang Lingkup Penelitian

Pembatasan masalah dilakukan untuk menghindari pembahasan yang melebar sehingga dilakukan asumsi sebagai berikut:

1. *Barge* yang digunakan saat peluncuran adalah *Launch barge S-45* dengan berat *barge* 15700 tons, panjang *barge* 180 m, lebar *barge* 42 m, dan tinggi *barge* 11.5 m.
2. *Jacket* yang akan di-launching adalah The LD22-1 CEP *jacket* yang mempunyai delapan kaki dan 12 *skirt piles*. Estimasi berat *jacket* 4259.3 metric ton.
3. Analisa tidak menyertakan analisa kekuatan untuk struktur *skidway* selama peluncuran.
4. Analisa hanya menyertakan analisa gaya yang bekerja pada *rocker arm*.
5. Kedalaman lokasi peluncuran adalah 93.5 meters.
6. Analisa yang dilakukan dengan memperhitungkan 1 arah datang gelombang yaitu *head seas* (0 derajat).
7. Analisa stabilitas *barge* adalah arah rolling dan pitching.
8. Beban lingkungan yang bekerja hanya beban gelombang dan beban angin.
9. Analisa dinamis yang dipakai adalah analisa time domain.

1.6. Sistematika Penulisan

Sistematikan penulisan yang digunakan dalam penyusunan Tugas Akhir ini adalah sebagai berikut :

Bab I Pendahuluan

Bab ini menjelaskan tentang latar belakang penulisan, permasalahan yang dibahas dalam penulisan, tujuan yang ingin dicapai, manfaat, serta batasan masalah yang digunakan.

Bab II Tinjauan Pustaka dan Landasan Teori

Dalam penyelesaian laporan Tugas Akhir ini penulis melakukan tinjauan pustaka pada beberapa penelitian mengenai optimasi dan perancangan pipa bawah laut yang pernah dilakukan sebelumnya.

Bab III Metodologi

Pada bab ini menerangkan langkah-langkah pengerjaan yang dilakukan, diawali dari studi literatur, pengumpulan data, kemudian pemodelan.

Bab IV Hasil dan Pembahasan

Pada bagian ini akan menampilkan hasil yang telah didapat dari perhitungan yang dilakukan, evaluasi dari penelitian sebelumnya, menvalidasi hasil serta membahas hasil yang telah didapat.

Bab V Kesimpulan dan Saran
Bab ini berisi kesimpulan yang dapat ditarik dari keseluruhan hasil analisa dan pembahasan. Pada bab ini juga berisikan saran sebagai tindak lanjut penelitian untuk permasalahan terkait.

Untuk penelitian ini, diperoleh kesimpulan bahwa pengaruh faktor lingkungan terhadap kualitas hasil produksi pada industri pangan di Kabupaten Cirebon adalah faktor-faktor lingkungan yang berpengaruh pada hasil produksi. Faktor lingkungan yang berpengaruh pada hasil produksi pangan antara lain faktor lingkungan air, faktor lingkungan tanah, faktor lingkungan iklim, faktor lingkungan teknologi dan faktor lingkungan sosial.

Dari hasil analisis faktor lingkungan terhadap hasil produksi pangan di Kabupaten Cirebon diperoleh kesimpulan bahwa faktor lingkungan air berpengaruh positif terhadap hasil produksi pangan. Dapat diketahui bahwa faktor lingkungan air berpengaruh positif terhadap hasil produksi pangan dengan nilai koefisien 0,000257. Tingkat signifikansi faktor lingkungan air pada hasil produksi pangan adalah 0,000 < 0,05, sehingga faktor lingkungan air berpengaruh terhadap hasil produksi pangan.

Faktor lingkungan tanah berpengaruh negatif terhadap hasil produksi pangan. Dapat diketahui bahwa faktor lingkungan tanah berpengaruh negatif terhadap hasil produksi pangan dengan nilai koefisien -0,000257. Tingkat signifikansi faktor lingkungan tanah pada hasil produksi pangan adalah 0,000 < 0,05, sehingga faktor lingkungan tanah berpengaruh negatif terhadap hasil produksi pangan.

Faktor lingkungan iklim berpengaruh positif terhadap hasil produksi pangan. Dapat diketahui bahwa faktor lingkungan iklim berpengaruh positif terhadap hasil produksi pangan dengan nilai koefisien 0,000257. Tingkat signifikansi faktor lingkungan iklim pada hasil produksi pangan adalah 0,000 < 0,05, sehingga faktor lingkungan iklim berpengaruh positif terhadap hasil produksi pangan.

Faktor lingkungan teknologi berpengaruh positif terhadap hasil produksi pangan. Dapat diketahui bahwa faktor lingkungan teknologi berpengaruh positif terhadap hasil produksi pangan dengan nilai koefisien 0,000257. Tingkat signifikansi faktor lingkungan teknologi pada hasil produksi pangan adalah 0,000 < 0,05, sehingga faktor lingkungan teknologi berpengaruh positif terhadap hasil produksi pangan.

BAB II

TINJAUAN PUSTAKA DAN DASAR TEORI

2.1. Pendahuluan

Salah satu faktor penting dalam mendisain *offshore jacket* adalah metode instalasi. Tergantung dari metode instalasi, stress yang diterima member struktur jacket selama instalasi berubah-ubah yang diimplikasikan oleh dimensi dan spesifikasi member. Untuk instalasi *jacket* yang besar, metode *launching* sering kali digunakan. Meskipun proses *launching* tidak membutuhkan waktu yang lama, pengoperasiannya menghasilkan kesuksesan atau kegagalan instalasi (Kim, et al ,2001).

Kegagalan instalasi dapat mengakibatkan ; kerusakan pada *local member*, kerusakan pada barge, *overtuning unit* (*jacket* dan *barge* terbalik dan tenggelam), dan mungkin juga kehilangan struktur (Gerwick, 1986). Analisa *launching* harus memperhatikan beberapa parameter seperti lingkungan, dimensi dan spesifikasi *jacket*, dimensi dan spesifikasi *launching barge*, dan stabilitas kombinasi *barge* dan *jacket*. *Launching jacket* biasa dilakukan pada kondisi laut *calm water*.

2.2. Instalasi *Jacket*

Proses instalasi *jacket* merupakan satu proses yang penting dalam pembangunan anjungan *Jacket*. Untuk instalasi *jacket* ada tiga cara yang bisa dipertimbangkan: *Lifting* (diangkat), *launching* (diluncurkan), dan *self floating* (Soegiono, 2004). Adapun penjelasannya yaitu:

a. *Lifting*

untuk *Jacket* yang relatif kecil biasanya bisa dibangun pada posisi tegak, kemudian *jacket* diangkat ke atas *cargo barge* dalam posisi tegak. Setelah sampai pada lokasi *jacket* diposisikan dengan menggunakan *crane barge*.

Untuk *Jacket* yang tingginya sekitar 50-60 m, di fabrikasi dalam posisi rebah, diangkat diatas *barge* dalam posisi rebah, dan kemudian diangkat dengan *crane barge* dan dimasukkan ke dalam air sampai posisi duduk diatas *seabed*.

2.2. Transportasi dan Peluncuran

Gambar 2.1 *Transportasi Jacket*

b. *Self Floating*

Jacket yang sangat besar umumnya dibangun dengan *temporary floatation tanks* sehingga setelah diluncurkan ke air langsung ditarik dengan kapal tunda ke lokasi.

Extra wave loads perlu di pertimbangkan pada waktu instalasi dengan cara ini.

c. *Launching*

Jacket yang ukurannya lebih besar dari *crane barge* biasanya di pasang dengan cara diluncurkan. Proses peluncuran *Jacket* dari *cargo barge* dengan mem-*ballast-ing* *cargo barge* sampai kemiringan tertentu dimana *Jacket* dapat meluncur ke air. Setelah *Jacket* berada di air, *jacket* dapat mengapung dengan sendirinya karena *bouyancy-nya* atau dengan *floatation tank* sementara. Untuk menegakkan dan memposisikan *jacket* di dasar laut digunakan *crane barge*. Adapun langkah-langkah dalam peluncuran (Kim, et al ,2001) yaitu:

a. *1st-sliding stage*

Jacket meluncur sepanjang *skid beams* karena beratnya sendiri.

b. *2nd-rotating stage*

Jacket berotasi pada *rocker arms pin* ketika momen *overtuning* lebih besar dari *up-righting* momen

c. 3rd-sliding and rotating stage

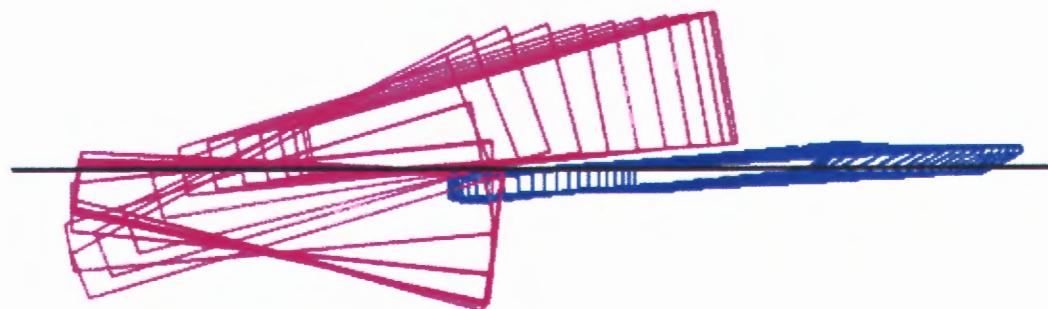

Setelah berotasi pada *rocker arm*, *Jacket* berotasi dan meluncur secara bersamaan.

d. 4th-clearing stage

Jacket lepas sepenuhnya dari *barge* dan mengapung di perairan.

2.3. Launching Jacket

Launching adalah langkah terakhir pada analisa transportasi. Gambar dibawah merupakan proses dari peluncuran secara komplit dari tahap-pertahap.

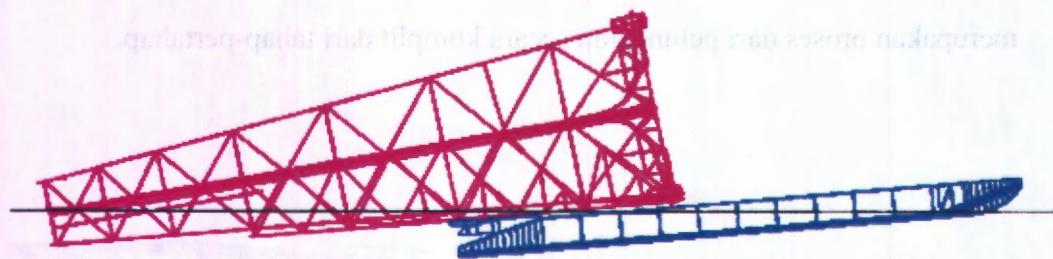

Gambar 2.2 Ilustrasi Launching Jacket

- Proses pertama adalah proses *ballasting* kapal, sehingga kapal miring dengan sudut tertentu. *Barge* di-*trim* dengan sudut yang agak besar 2 sampai 4 derajat dimana struktur tidak meluncur karena beratnya sendiri. Hal ini dimaksudkan untuk mengamankan sudut *tilting* yang lebih besar selama mungkin sehingga jacket tidak tiba-tiba meluncur karena beratnya sendiri. Pada ilustrasi ini kita bisa melihat *barge* di-*trim* 4 derajat dan *tilt beam* tenggelam. *Seafastenings* diputus dan jacket meluncur dari *barge* menuju ke air.

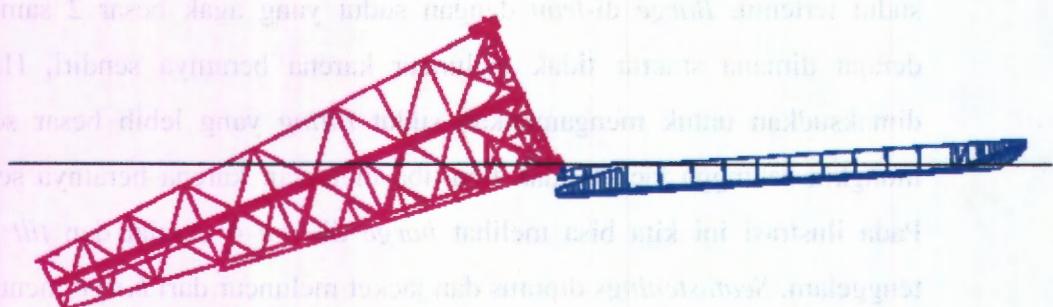

Gambar 2.3 *Pre-launching Jacket*

- Dari proses pertama, selanjutnya *jacket* meluncur sepanjang *skid-way* untuk beberapa waktu sampai *jacket* mengalami “*tipping*”.

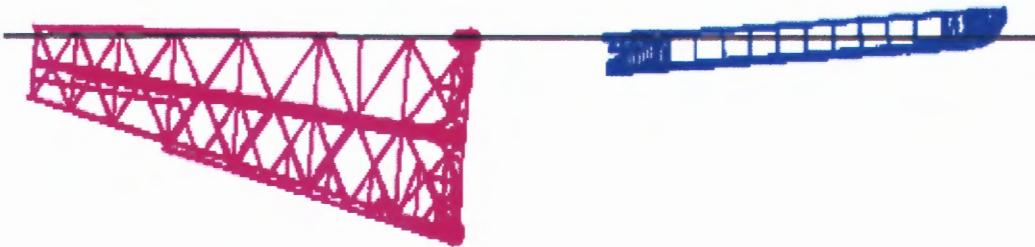

Gambar 2.4 *sliding stage*

- Pada ilustrasi selanjutnya, *jacket* akan meninggalkan *barge skidway* dan *tilt beams* berotasi bersamaan dengan jatuhnya *jacket* ke air. Setelah mengalami *tipping*, *jacket* berotasi dan meluncur sampai terpisah dari *barge*.

Gambar 2.5 *rotating stage*

- *Jacket* terlepas dari *barge*, berosilasi untuk beberapa detik dan akhirnya mengapung dengan stabilitasnya sendiri.

Gambar 2.6 *clearing stage*

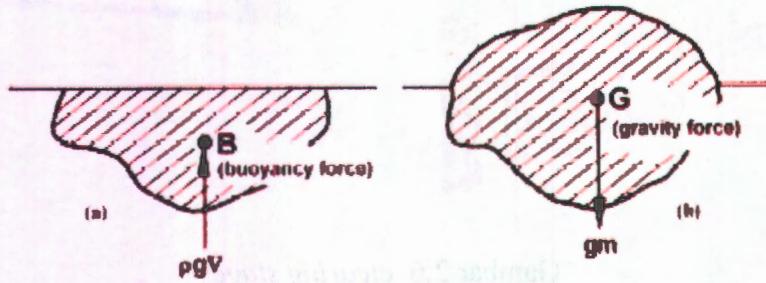

Hal penting yang patut diperhatikan adalah daya apung *jacket* setelah lepas dari *barge*. Jika posisi akhir *jacket* sangat berbeda dari posisi seperti ilustrasi diatas, maka *jacket* akan sangat tidak stabil.

Untuk beberapa teknikal faktor yang lain selama *launching* beberapa hal terjadi., tetapi hal yang paling penting adalah perubahan gaya yang dialami *barge* akibat perubahan posisi *jacket* saat *launching*. Hal ini saat mempengaruhi stabilitas dari *launching barge*. Perubahan gaya yang dialami *barge* adalah sistem gaya yang bekerja pada jacket dipresentasikan sebagai dua gaya pada *rocker pin* dan dua gaya pada *trailing edges* pada *launch legs*. Pada permulaan, gaya pada *trailing edge* mempunyai harga dan semakin menurun, sebaliknya pada *rocker pins* mulai mempunyai harga dan semakin meningkat. Hal ini tentu sangat berpengaruh pada stabilitas kapal.

2.4. Stabilitas Bangunan Apung Statis

Pada saat air tenang bangunan apung seperti kapal memiliki titik berat dan gaya *buoyancy* (gaya apung) yang tetap dan tidak ada gerakan. Namun jika ada masa tambah yang terjadi akibat proses peluncuran (*launching operation*), maka terjadi perubahan titik berat dan ada gerakan *barge* yang ditimbulkan. Gaya hidrostatik dan momen dikarenakan lingkungan laut berinteraksi dengan kapal. *Buoyancy* volume tercelup adalah volume kapal yang terendam yang berada dibawah garis air. Volume tersebut memiliki titik *buoyancy*. Titik berat (*Center of Gravity*, CoG) adalah titik berat kapal dalam keadaan statik (Journee dan Massie, 2001).

2.4.1. Peramaan vertikal

Gambar 2.7 Definisi Titik Tengah dan Gaya (Journee and Massie, 2001).

Jika struktur mengalami pergerakan heave negatif (tenggelam lebih dalam) maka akan ada peningkatan gaya apung sehingga mengakibatkan kapal bergerak kembali keatas untuk kembali ke titik kesetimbangan awal. Untuk menghitung gaya apung dan gravitasi digunakan prinsip Archimedes:

$$\rho g \nabla = gm \quad \dots \dots \dots (2.1)$$

dengan, ρ = massa jenis air laut, $1025 \frac{kg}{m^3}$
 g = percepatan gravitasi , $9,81 \frac{m}{s^2}$

∇ = volume tercelup, m^3

m = massa kapal , ton

Jika ada tambahan massa diletakkan diatas kapal atau karena adanya jacket diatas barge, maka persamaan awalnya akan berubah. Kapal akan tenggelam lebih dalam dan bergerak roll atau biasa disebut heel sampai titik kesetimbangan baru tercapai.

Persamaan vertikal yang barunya adalah :

$$\rho g (\nabla + \Delta \nabla) = g (m + p) \quad \dots \dots \dots (2.2)$$

dengan, $\Delta \nabla$ = penambahan volume displasmen yang tercelup

p = massa beban yang dipindahkan.

Jika kapal tenggelam lebih dalam maka ada perubahan tinggi air (draft, ΔT) dengan asumsi tidak ada gerakan heel, yang didapat dari persamaan berikut:

$$\Delta\nabla = \Delta T \cdot Awl = \frac{p}{\rho} \quad \text{atau} \quad \Delta T = \frac{p}{\rho \cdot Awl} \quad \dots \dots \dots \quad (2.3)$$

dengan, A_{WL} = luasan bidang garis air (area of water plane).

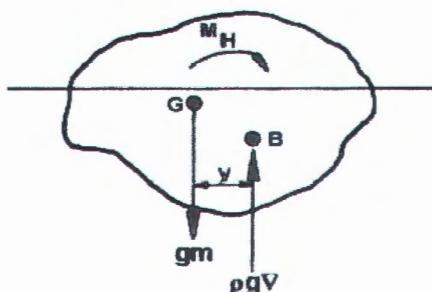

2.4.2. Persamaan rotasional

Jika momen heel yang bekerja pada kapal sebagaimana dalam Gambar 2.8 maka persamaan rotasionalnya adalah:

$$M_H = \rho g \nabla \cdot y = gm \cdot y \quad \dots \dots \dots \quad (2.4)$$

Dari persamaan diatas jika panjang lengan y sama dengan nol, atau tidak ada momen eksternalnya yang bekerja maka;

$$M_H = 0 \quad \text{hasil dalam} \quad y = 0 \quad \dots \dots \dots \quad (2.5)$$

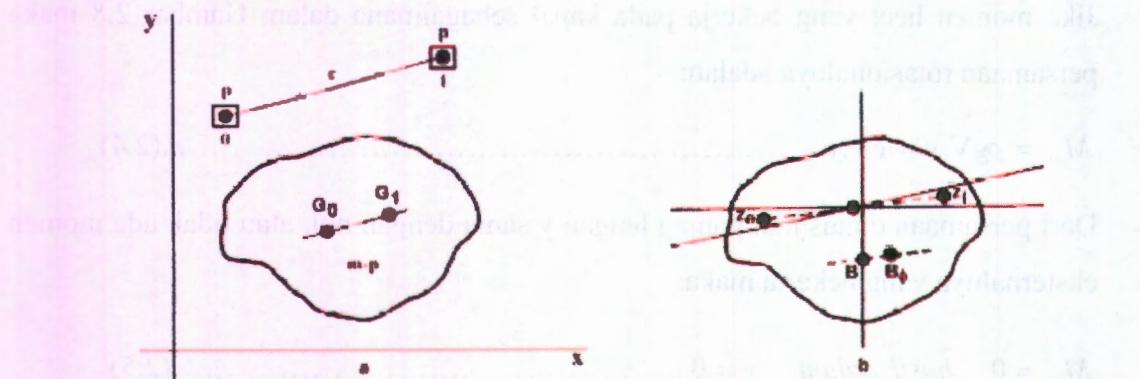

Gambar 2.8 Heeling Moment (Journee and Massie, 2001)

Hal ini berarti bahwa jika kapal dalam keadaan diam maka titik berat G dan titik apung berada dalam satu garis. Jika tidak struktur akan mengalami gerakan rotasi heel (roll) atau trim (pitch).

2.4.3. Perpindahan massa dan volume

Jika suatu beban dengan massa p dipindahkan ke kapal dengan jarak c , maka titik gravitasi awal G_0 akan berpindah secara parallel ke titik G_1 , panjang perpindahannya adalah:

$$\overline{G_0 G_1} = \frac{p.c}{m} \quad \dots \dots \dots (2.6)$$

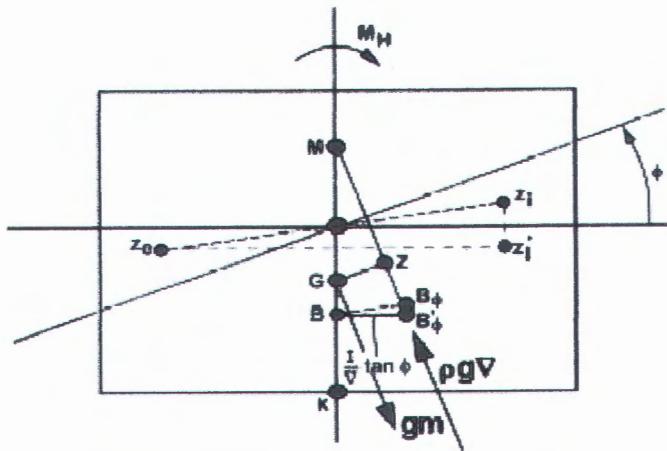

Gambar 2.9 Perpindahan Massa dan Titik Apung (Journee and Massie, 2001).

Perpindahan titik apung B ke B_1 paralel dengan garis $\overline{z_0 z_1}$ titik tengah volume tercelup dan yang muncul garis permukaan air ketika kapal heeling karena adanya momen eksternal.

2.4.4. Moment Barge

Untuk contoh kasus digunakan barge kotak dengan panjang L , lebar B , dan draft T mengalami heeling dengan sudut heel ϕ . Bagian yang tercelup dan muncul permukaan air dibatasi oleh garis air. Karena adanya momen eksternal titik apung dan gravitasi berpindah sebagaimana dalam gambar dibawah.

Gambar 2.10 Stabilitas Barge Kotak (Journee and Massie, 2001).

Karena moment heeling bentuk garis air menjadi berubah, titik apung berpindah dari B ke B_ϕ paralel dengan garis $\overline{z_0 z_1}$ yang titik tengah volume tercelup. Titik M adalah titik metacenter perpotongan garis apung (pengembali) dengan garis vertikal saat diam dengan sudut heeling ϕ . Persamaan baru akan didapat ketika moment stabilitas kapal M_s sama dengan momen horizontal M_H .

$$M_s = \rho g \nabla \overline{GZ} = \rho g \nabla \overline{GM} \sin \Phi = M_H \dots\dots\dots(2.7)$$

Posisi awal titik metacenter dapat dihitung dengan mudah dalam keadaan khusus. Heeling ini menyebabkan perpindahan horizontal titik tengah buoyancy $\overline{B_0 B_\phi} = \overline{BM} \cdot \tan \phi$. Momen pertama dengan garis vertical akibat heeling didapatkan sebagai berikut:

$$\overline{BM} = \frac{I_T}{\nabla} \dots\dots\dots(2.8)$$

$$\overline{BM} = \frac{\frac{1}{12} \cdot L \cdot B^3}{L B T} = \frac{B^2}{12 T} \quad (\text{barge}) \dots\dots\dots(2.9)$$

Lengan stabilitas $\overline{GZ} = \overline{GM} \cdot \sin \phi$ ditentukan oleh properti hidrostatik bagian yang tenggelam dan titik berat barge.

$$\overline{GM} = \overline{KB} + \overline{BM} - \overline{KG} \dots\dots\dots(2.10)$$

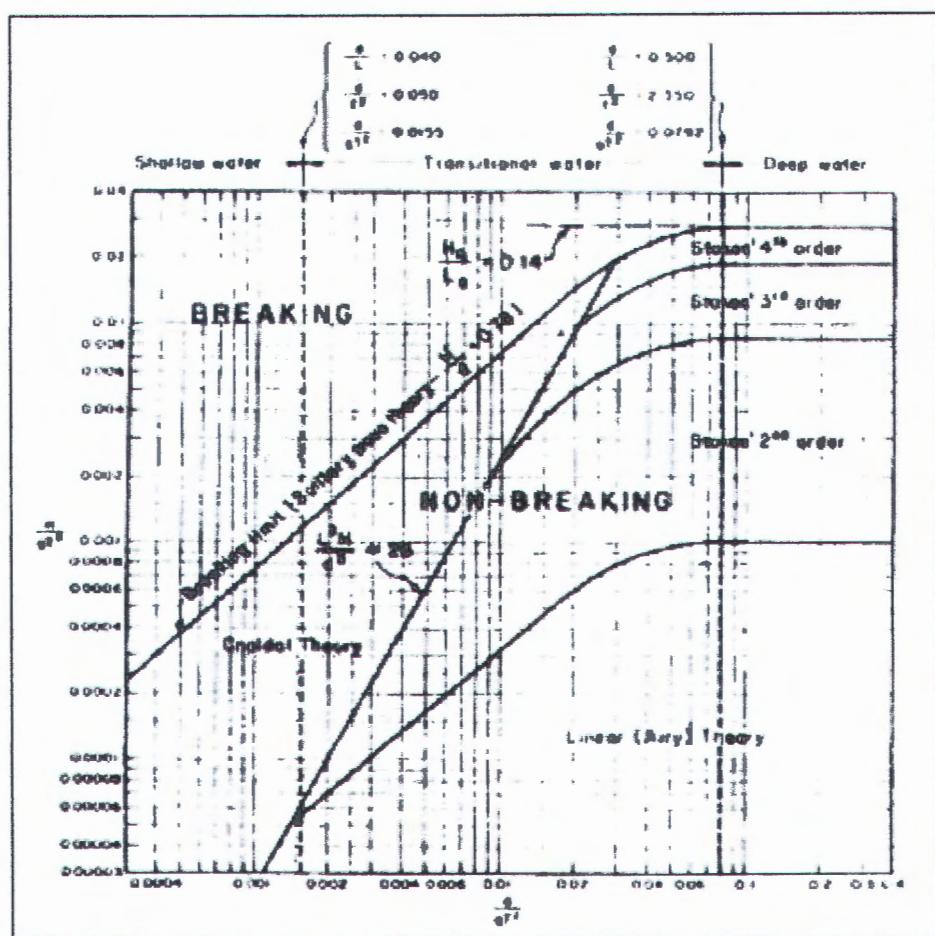

2.6. Beban gelombang

Penentuan Teori Gelombang

Penentuan teori gelombang yang akan digunakan dapat dilakukan dengan menggunakan grafik validitas yang disebut "*Region of Validity of Wave Theories*" dengan menggunakan parameter-parameter gelombang yang ada seperti tinggi gelombang (H), periode gelombang (T), dan kedalaman air (d). Dengan pendekatan formulasi matematika, Mousseli (1981) memberikan rumusan sebagai berikut :

$$\frac{H}{gT^2} \text{ dan } \frac{d}{gT^2} \quad (2.20)$$

Hasil dari formulasi matematika tersebut kemudian disesuaikan dengan grafik Daerah Aplikasi Teori Gelombang seperti terlihat pada gambar 2.14, sehingga dapat diketahui teori gelombang yang digunakan.

Gambar 2.12. Grafik *Region of Validity* (Mousseli , 1981)

Contoh penentuan properti gelombang dengan teori gelombang Stokes Orde 2 dan Orde 3. Panjang gelombang sebagai fungsi dari kedalaman untuk teori gelombang Stokes Orde 2 diperoleh dari iterasi persamaan berikut :

$$L = \frac{gT^2}{2\pi} \tanh \frac{2\pi d}{L} \quad (2.21)$$

Sedangkan untuk Stokes Orde 3 Hsu (1984) memberikan formula sebagai berikut :

$$L = \frac{gT^2}{2\pi} \tanh kd \left\{ 1 + \left(\frac{2\pi d}{L} \right)^2 \left[\frac{14 + 4 \cosh^2 2kd}{16 \sinh^4 kd} \right] \right\} \quad (2.22)$$

Panjang gelombang dan tinggi gelombang mula-mula diperoleh dari persamaan berikut (Triatmodjo, 1999):

$$L_o = 1,56 T^2 \quad (2.24)$$

$$H = K_s H_o \quad (2.25)$$

Keterangan :

- L = Panjang gelombang pada kedalaman tertentu (m)
- Lo = Panjang gelombang awal (m)
- g = Percepatan gravitasi (m/dt^2)
- T = Periode gelombang (dt)
- D = Kedalaman perairan (m)
- H = Tinggi gelombang pada kedalaman tertentu (m)
- Ho = Tinggi gelombang awal (m)
- Ks = Koefisien shoaling / pendangkalan

2.7. Beban Angin

Beban angin merupakan beban dinamis, tapi beberapa struktur akan meresponnya pada model statis yang paling mendekati. Dalam perancangan sebuah *offshore structure* pada umumnya, perhitungan beban angin disyaratkan untuk didasarkan pada besarnya kecepatan ekstrim dengan waktu pengulangan 50 atau 100 tahun. Semakin lama waktu yang digunakan untuk pengulangan, maka resiko kegagalan semakin besar.

Perhitungan gaya yang ditimbulkan oleh angin sebagai berikut (API RP 2A WSD):

$$F = (w/2g)(V)^2 C_s A \dots\dots\dots\dots\dots(2.27)$$

dimana:

F = gaya angin

w = densitas berat udara, (0.0023668 slugs/ft³ untuk standart P dan T)

V = kecepatan angin (m/sec)

C_s = koefisien bentuk

A = luas area (m²)

Sedangkan kecepatan angin dirumuskan sebagai berikut:

$$V_y = V_{10} \left(\frac{y}{10} \right)^x \dots\dots\dots\dots\dots(2.28)$$

dimana:

V_y = kecepatan angin

V_{10} = kecepatan angin pada ketinggian 10 m

y = ketinggian dimana kecepatan angin dihitung

x = faktor eksponen

Bila informasi yang akurat tidak tersedia, maka harga eksponensial x sebesar $1/7$ dapat diambil sebagai pendekatan. Harga ini cukup sesuai untuk ketinggian sampai dengan sekitar 200 m. Untuk semua sudut dari pendekatan beban angin pada struktur, gaya pada permukaan datar diasumsikan sebagai gaya normal pada permukaan dan gaya pada tanki silinder vertikal, pipa, dan silinder lain diasumsikan searah dengan arah angin, sedangkan yang tidak vertikal dapat dihitung menggunakan formula yang diambil dari perhitungan arah angin berhubungan dengan gerak objek.

2.8. Analisa Dinamis

Tujuan dari rangkaian analisa dinamis penelitian ini pertama adalah untuk mendapatkan frekuensi natural struktur tanpa redaman dan kemudian mencari respon struktur terhadap pembebanan dinamis yang dalam hal ini menggunakan beban gelombang.

Menurut API RP 2T, analisa dinamis struktur lepas pantai terdapat 2 metode analisa domain, yaitu:

1. *Frequency domain analysis* adalah simulasi kejadian pada saat tertentu dengan interval frekuensi yang telah ditentukan sebelumnya. Frekuensi domain juga dapat digunakan untuk memperkirakan respon gelombang acak termasuk gerakan platform dan percepatan, gaya tendon dan sudut. Keuntungannya adalah lebih menghemat waktu perhitungan dan juga input atau output lebih sering digunakan oleh perancang. Namun kekurangannya metode ini adalah semua persamaan non-linier harus diubah dalam bentuk linear.
2. *Time domain analysis* adalah penyelesaian gerakan dinamis struktur berdasarkan fungsi waktu. Pendekatan yang dilakukan dalam metode ini menggunakan prosedur integrasi waktu dan akan menghasilkan respon *time history* berdasarkan waktu $x(t)$.

Metode *time domain solution* secara umum digunakan untuk tahap final detail desain dan untuk mengecek solusi *frequency domain*. Metode *time domain* biasanya digunakan untuk analisis kondisi ekstrim tetapi tidak digunakan untuk analisis fatigue atau analisis kondisi lebih moderat dimana analisis linierisasi bekerja lebih effisien.

Sejak integrasi numerik langsung persamaan motion dilakukan, pengaruh-pengaruh fungsi-fungsi nonlinier gelombang relevan dan variabel-variabel motion diikutkan. Keuntungan dari metode *time domain* dibanding metode *frequency domain* adalah semua tipe *non-linier* (matrik sistem dan beban-beban eksternal) dapat dimodelkan dengan lebih tepat. Ketidakuntungannya adalah memerlukan waktu menghitung yang lebih banyak, seperti periode simulasi memerlukan waktu panjang. Simulasi *time domain* dapat dikerjakan menurut beberapa skema integrasi. Untuk dapat mewakili kondisi sebenarnya simulasi minimal dilakukan selama 3 jam.

2.8.1 Analisa Dinamis *Time Domain*

Metode *time domain* biasanya digunakan untuk tahap final detail desain dan untuk mengecek solusi *frequency domain*. Metode *time domain* biasanya digunakan untuk kondisi ekstrim tetapi tidak digunakan untuk analisa *fatigue* atau analisa kondisi

lebih moderat dimana analisa linierisasi bekerja lebih efisien. Keuntungan dari metode *time domain* dibanding metode *frequency domain* adalah semua tipe *non-linear* (matrik sistem dan beban-beban eksternal) dapat dimodelkan dengan lebih tepat. Kerugiannya adalah diperlukan waktu yang lebih lama. Untuk dapat mewakili kondisi sebenarnya, simulasi minimal dilakukan selama 3 jam (DNV-OS-301)

Pada analisa *timr domain* umumnya keseimbangan dinamis dari *multi degree of freedom* sistem dapat diformulasikan sebagai berikut:

$$\mathbf{F}^I(t) + \mathbf{F}^D(t) + \mathbf{F}^S(t) = \mathbf{Q}(t, r, i) \quad \dots \dots \dots (2.26)$$

dimana:

\mathbf{F}^I = vektor gaya inersia

\mathbf{F}^D = vektor gaya damping

\mathbf{F}^S = vektor gaya kekakuan

\mathbf{Q} = vektor beban luar, harmonik atau fungsi *stochastic* dari waktu

Ada banyak metode numerik yang telah dikembangkan untuk menyelesaikan persamaan gerak pada analisa *time domain* yaitu menggunakan teknik integrasi *direct step by step*. Metode *Newmark-Wilson* dan *Range-kutta* umumnya dipakai untuk menyelesaikan persamaan differential *second order*. Bila analisa digunakan untuk gelombang reguler tunggal, maka ketergantungan frequency dari *added mass* dan koefisien damping untuk periode gelombang tertentu dapat secara langsung digunakan. Ketika analisa dilakukan pada *random sea* maka pertimbangan seharusnya diberikan ketergantungan frekuensi terhadap masa tambah dan koefisien dampingnya.

Dengan menyelesaikan persamaan tersebut menggunakan prosedur integrasi waktu, didapat solusi pada pola *responss time history* (*t*). Pada umumnya semua matrik sistem (*massa*, *dampingi*, dan *kekakuan*) dapat difungsikan sebagai respon atau waktu, seperti pada kasus vektor beban (analisa *non-linear*). Matrik sistem konstan memberikan analisa *linear*. Output dari analisa *time domain* adalah respon *time series* dimana:

1. Simulasi gelombang reguler dapat digunakan untuk memprediksi *transfer function* dengan mengambil rasio respons amplitude dengan input amplitudo gelombang.
2. Spektrum respons dapat dihitung dari *time series*, memberikan informasi yang sama dengan analisa *frequency domain*.
3. Respons ekstrim dapat diestimasi secara langsung dari puncak respons selama simulasi.

Langkah dasar dalam analisa respon struktur berdasarkan *time domain* :

1. Menentukan kedalaman perairan, H_s , T_z arah θ untuk kondisi perairan yang akan dianalisa.
2. Menentukan *spectrum surface elevation* untuk menggambarkan kondisi perairan.
3. Nyatakan spectrum sebagai *spectrum amplitude*.
4. Tentukan secara acak sudut fase ϕ_b untuk setiap *spectral ordinat* η_b pada kelompok frekuensi.
5. Menentukan *water surface elevation* (untuk kasus tidak ada penyebaran) dengan :
$$\eta(t) = \sum_{b=1}^n \eta_b \Delta f_b \cos\left(2\pi\left(\frac{x}{L} - \frac{t}{T}\right) + \phi_b\right)$$
6. Menentukan kecepatan pertikel dengan penjumlahan yang sama dari komponen teori gelombang linier.
7. Menentukan beban gelombang berdasarkan waktu (*time domain*) dengan nilai penjumlahan dari kecepatan dan percepatan dan persamaan Morison
8. Menentukan respon struktur berdasarkan waktu dengan menggunakan analisa dinamis berdasarkan waktu (*time domain dynamic analysis*).
9. Analisa hasil dari *time domain dynamic analysis* untuk menentukan nilai statistik yang diperlukan untuk mendapatkan nilai maksimum dari respon struktur.

2.10. MOSES

2.10.1 MOSES rev. 7.00

Pemodelan struktur *jacket* dan *barge* dilakukan dengan menggunakan *software* MOSES (*Multi Operational Structural Engineering Simulator*) rev. 7.00.

Pemodelan dilakukan untuk mendapatkan panel hidrodinamis. Panel hidrodinamis berguna untuk mengetahui seberapa besar gaya dan tegangan yang bekerja pada panel (*meshing*) yang dianalisis pada MOSES rev.6 akibat adanya kondisi *seastate* tertentu.

2.10.2. MOSES rev.6.00

MOSES (*Multi Operational Structural Engineering Simulator*) adalah sebuah program simulasi yang memiliki kegunaan utama untuk menganalisa hampir semua struktur yang berada di lingkungan laut. Analisis dinamis *launching jacket* dilakukan dengan menggunakan software MOSES (*Multi Operational Structural Engineering Simulator*) rev. 6.00 yang dapat menganalisa *motion, stress, force, stabilitas* dan lain sebagainya.

Sistem Koordinat Barge dan Jacket pada Moses rev.6

Ada 3 macam system koordinat utama yang digunakan dalam pemodelan *launching jacket*. Yang pertama adalah koordinat SACS yang dipakai dalam memodelkan *jacket* pada SACS, koordinat lokal *jacket* pada MOSES yang mengacu pada koodinat global *jacket* dan koordinat MOSES global berdasarkan pada koordinat barge. Sistem koordinat *barge* teletak pada *keel* dan *bow*. Sistem koordinat *jacket* mengacu pada *barge* seperti diilustrasikan pada gambar di bawah ini

dimana sistem koordinat yang digunakan pada MOSES adalah sebagai berikut

dimana sistem koordinat yang digunakan pada MOSES adalah sebagai berikut

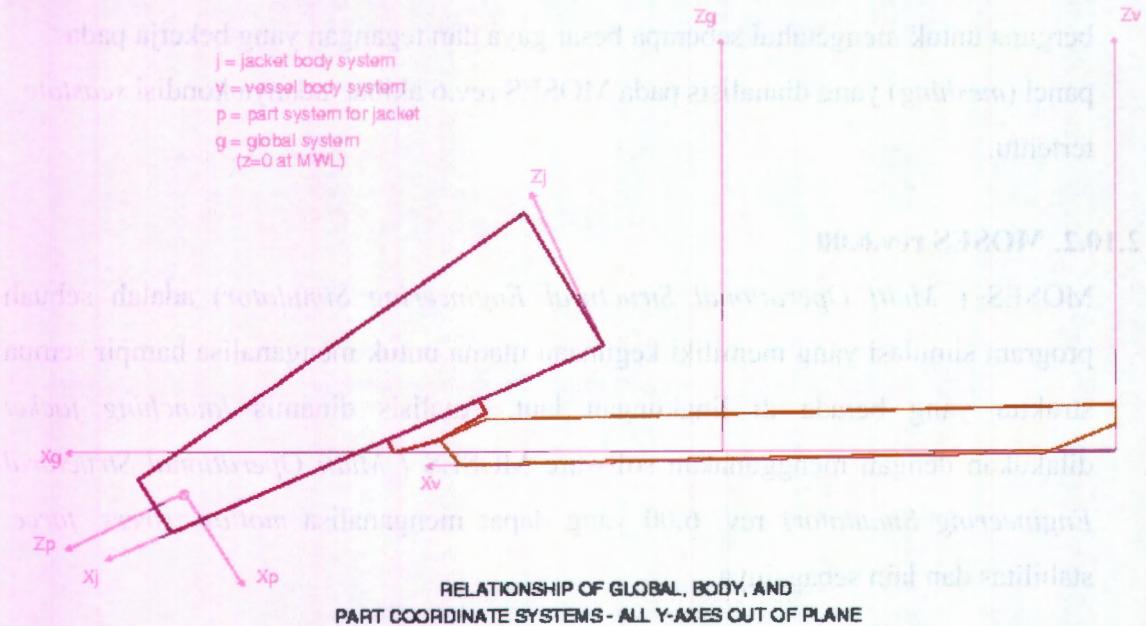

j = jacket body system

v = vessel body system

p = part system for jacket

g = global system

(z=0 at MWL)

Gambar 2.13. Sistem koordinat pada MOSES

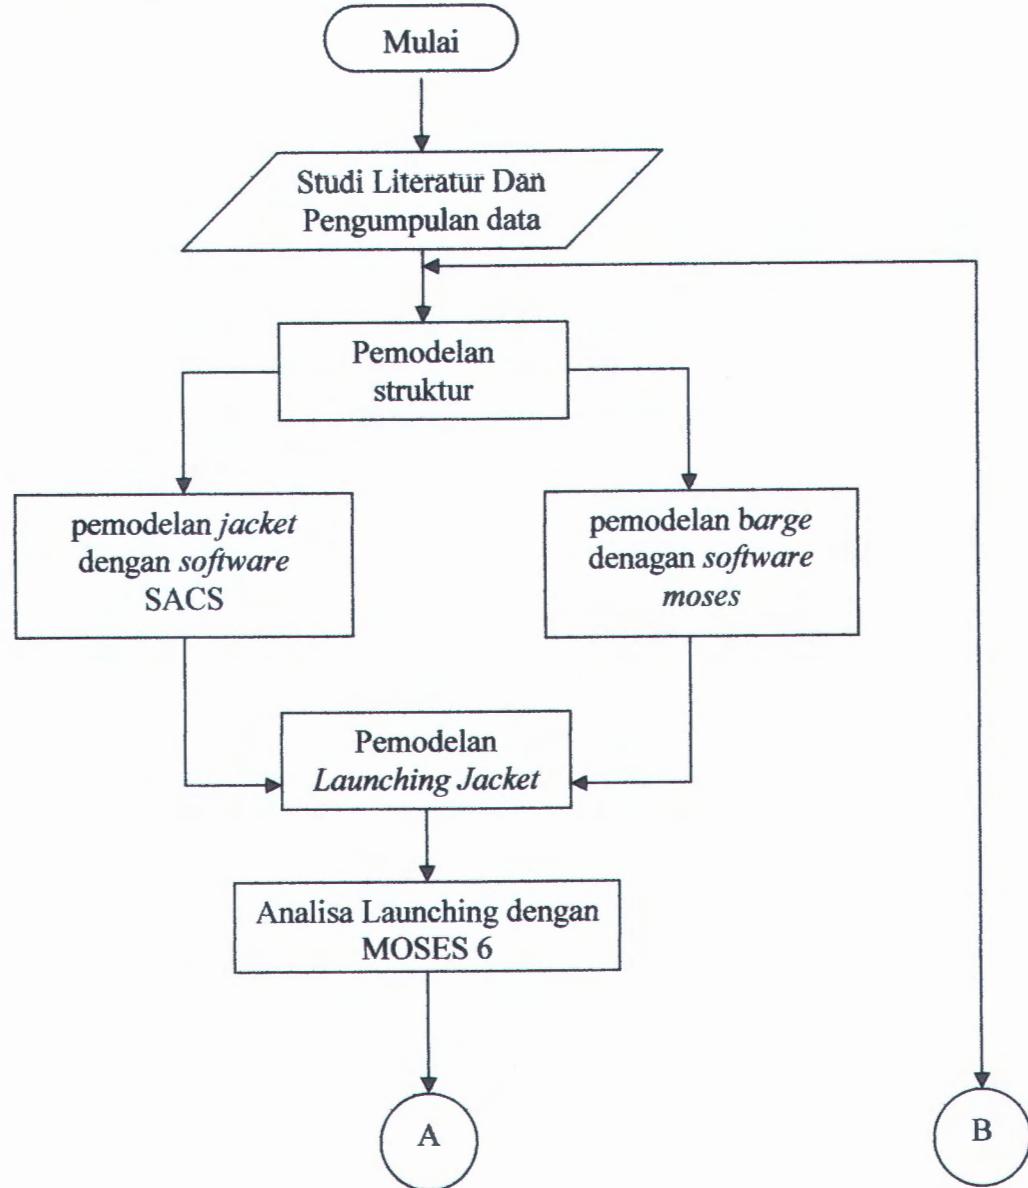

ini diambil dari referensi buku "Computer Aided Design of Offshore Structures" oleh Dr. Ir. H. S. Darmawibowo dan Dr. Ir. M. A. S. Al-Husseini. Pada gambar ini terdapat tiga sistem koordinat yang saling berhubungan: Sistem Koordinat Global (Z_g), Sistem Koordinat Vessel Body (X_g), dan Sistem Koordinat Jacket Body (Z_j). Sistem Koordinat Global (Z_g) merupakan sistem koordinat utama yang digunakan untuk mengukur posisi objek dalam ruang. Sistem Koordinat Vessel Body (X_g) dan Sistem Koordinat Jacket Body (Z_j) merupakan sistem koordinat sub yang digunakan untuk mengukur posisi objek dalam ruang relatif terhadap sistem koordinat global. Sistem Koordinat Part (X_p) juga terdapat pada gambar ini, namun tidak secara jelas ditunjukkan hubungannya dengan sistem koordinat lainnya. Dalam diagram ini, garis Z_g dan Z_j berjajar lurus, sedangkan garis X_g dan X_j berjajar lurus. Tinggi jacket diatas permukaan air laut (Mean Water Level) adalah 2320M + 201.5, dan total tinggi jacket adalah 2521.5.

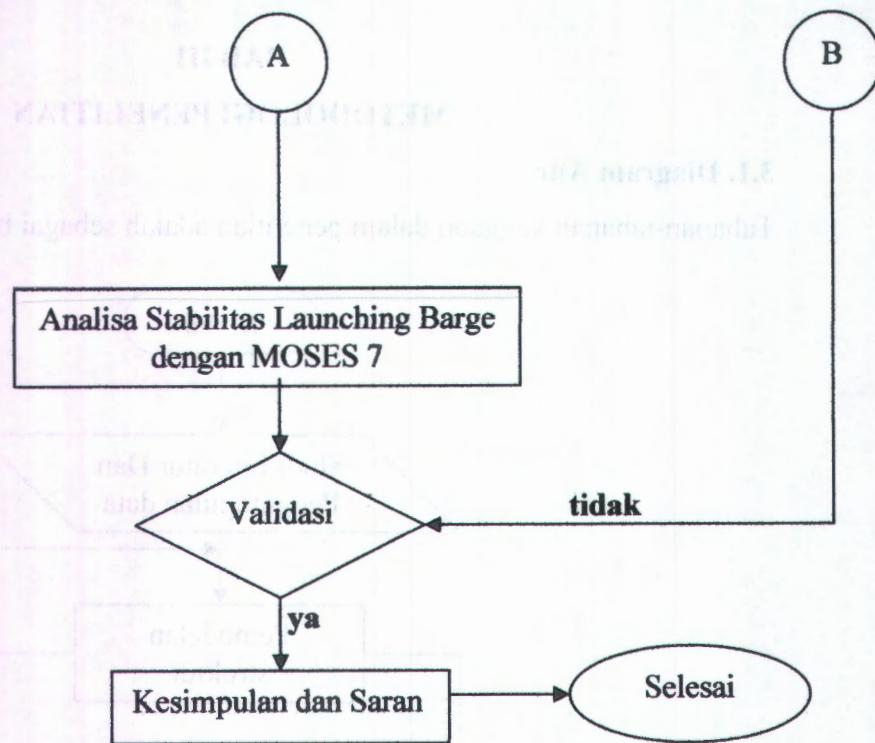

BAB III

METODOLOGI PENELITIAN

3.1. Diagram Alir

Tahapan-tahapan kegiatan dalam penelitian adalah sebagai berikut :

3.2. Penjelasan Diagram Alir

Penjelasan diagram alir :

Metode yang dipakai dalam analisa dinamis pada penelitian ini adalah metode numerik, dimana pemodelan struktur jacket dimodelkan dengan *software* SACS dan pemodelan *barge* dan analisa *stabilitas dinamis* dilakukan dengan menggunakan *software* MOSES. Adapun langkah-langkah yang akan dilakukan adalah sebagai berikut:

1. Studi Literatur dan pengumpulan data.

Penelusuran literatur ini ditujukan untuk mendapatkan data tentang *barge* dan *jacket* dan mengetahui penelitian yang telah dilakukan tentang stabilitas dinamis dari *barge*. Pengumpulan data lingkungan meliputi gelombang dan angin yang nantinya akan digunakan sebagai inputan beban lingkungan.

2. Menentukan variasi kondisi/beban lingkungan.

Menentukan beberapa variasi kondisi lingkungan untuk *calm water*.

3. Pemodelan struktur.

Pemodelan struktur *jacket* dilakukan dengan *software* SACS, pemodelan *barge* dan pemodelan beban yang bekerja pada *barge* dilakukan dengan bantuan *software* MOSES.

4. Pemodelan Launching

Setelah pemodelan struktur *jacket* dan *barge* selesai, maka dilakukan pemodelan *launching jacket* dengan menggunakan software *moses 6*.

5. Analisa Response

Setelah itu dilakukan *running* program untuk mendapatkan *bottom clearance*, *rocker arm reaction*, pergerakan dan kecepatan *jacket* pada saat *launching*.

6. Running MOSES

Kemudian dilakukan analisa stabilitas *barge* untuk kondisi awal, saat *jacket* mengalami tipping, dan *jacket* mulai berosilasi (terpisah dari *barge*) dengan arah pergerakan *barge roll* dan *pitch*.

7. Validasi

Model struktur yang sudah jadi harus diperiksa kesesuaiannya dengan data model laporan penelitian sebelumnya. Jika didapatkan harga *bottom clearance*, kecepatan peluncuran, *rocker arm reaction*, dan stabilitas yang memenuhi, maka dapat dilanjutkan ke proses selanjutnya.

8. Kesimpulan dan saran.

BAB IV

ANALISA DATA DAN PEMBAHASAN

4.1. Pengumpulan Data

Data-data yang diperlukan dalam penelitian ini meliputi data lingkungan, data jacket, dan data barge. Dimana data-data yang diperoleh tersebut kemudian dilakukan identifikasi, data yang diambil disesuaikan dengan kriteria yang dibutuhkan dalam penelitian ini.

4.1.1. Data Lingkungan

Proses instalasi *Jacket* dilakukan pada kondisi *calm water*. Karena proses instalasi *jacket* tidak mungkin dilakukan pada kondisi *rough water*.

Data lingkungan yang digunakan ialah pada kedalaman laut 93.5 meter, dengan tinggi gelombang (H) 0,5 meter, serta periode gelombang (T) sebesar 10 detik. Kecepatan angin pada permukaan air 25 m/detik.

4.1.2. Data Jacket

Jacket yang akan diluncurkan adalah The LD22-1 CEP Jacket yang mempunyai delapan kaki dan 12 skirt piles. Estimasi berat jacket adalah 5234.87 metric ton.

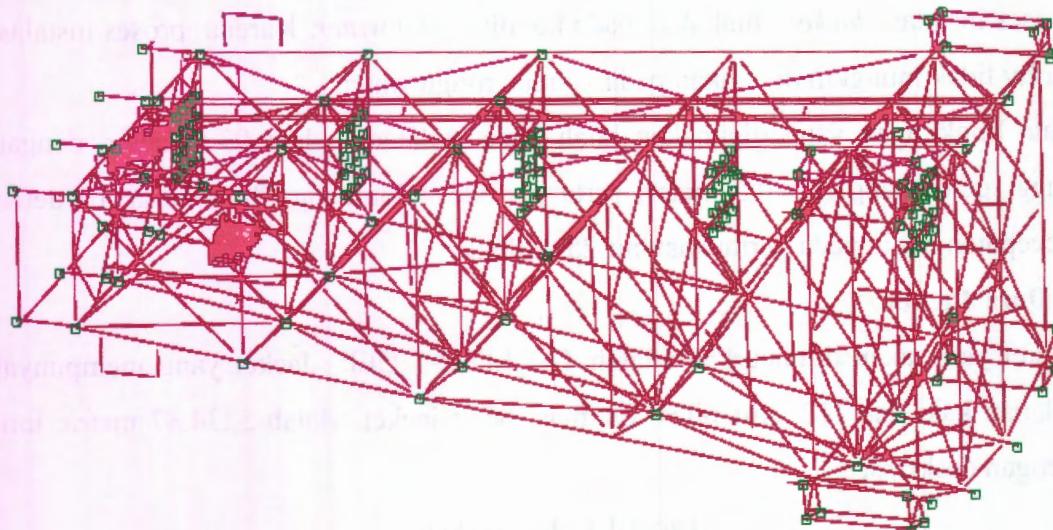

Dengan deskripsi :

Tabel 4.1 Data Jacket

No	Items	Berat (MT)
1	Jacket Primary Steel	4259.3
2	Anode	227.171
3	Walk way	18.435
4	Mudmat	195.185

Gambar 4.1 Gambar jacket posisi miring

4.1.3 Data Barge

Data barge yang digunakan dalam penelitian ini adalah seperti ditunjukkan dalam table di bawah ini.

Tabel 4.2 Data Barge

DATA	KETERANGAN
Barge name	S45 (PT. SAIPEM)
Length	180 meter
Breadth	42 meter
Depth	11,5 meter
Lightship	15700 tons
Rocker Arm	2 x 30 meter
Skid beam	2 x 164 meter

S45

Launching/cargo barge

CLASSIFICATION: RINA

DIMENSIONS: 180 m x 42 m x 11.5 m

Free deck area: 6.500 sq.m Deck capacity: 15 t/sq.m

Jacket weight: up to 20,000 t

JACKET HANDLING SYSTEM:

Skid beams: 2 x 164 m skid beams PTFE lined with paths for jacking units

Rocker arms: 2 x 30.5 m long double hinge type

Gambar 4.2. Data barge S45

4.2 Pemodelan Struktur

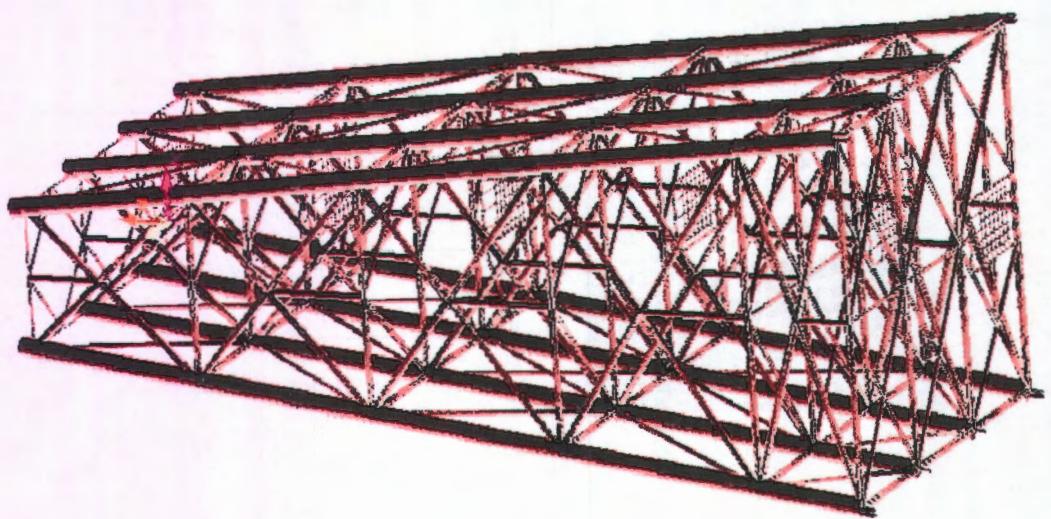

Pemodelan struktur jacket dan barge dilakukan dalam beberapa tahap, yaitu :

4.2.1. Pemodelan Struktur Jacket

Dalam penggeraan tugas akhir ini pemodelan struktur jacket dilakukan dengan menggunakan *software* SACS dan MOSES rev.6 secara bertahap, yaitu :

4.2.1.1. Pemodelan jacket dengan menggunakan *software* SACS.

Pemodelan dengan menggunakan *software* SACS bertujuan untuk memudahkan dalam memodelkan jacket. Dari pemodelan jacket pada SACS, maka dapat diperoleh berat jacket sebesar 4259.3 M-ton dan center of gravity (COG) yaitu - 45.96, 22.41, 14.39 (X,Y,Z) jacket yang berguna sebagai inputan dalam pemodelan pada MOSES rev 6.

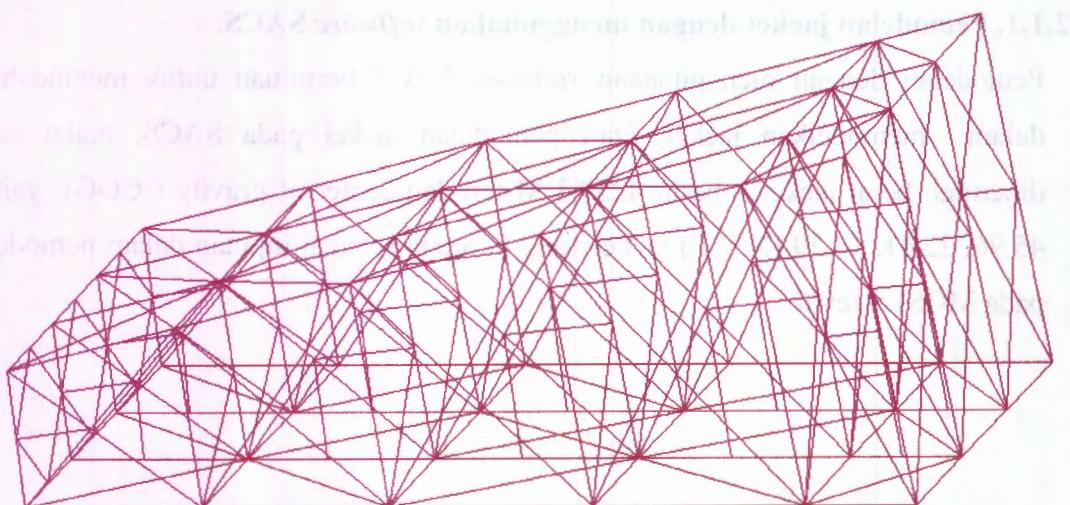

Gambar 4.3. Pemodelan Jacket dengan SACS

4.2.1.2. Pemodelan jacket dengan menggunakan *software* MOSES rev. 7

Setelah *jacket* dimodelkan pada SACS, selanjutnya model jacket pada SACS di convert ke *software* MOSES rev.7 dengan menambahkan perintah "&convert sacs" pada baris pertama file jacket.dat. Dari hasil runningan pada MOSES rev.7 di dapatka file yang berbentuk "file.ppo". Selanjutnya file ini yang digunakan sebagai "file.dat" pada pemodelan *launching* dengan menggunakan MOSES rev.6.

Pada *software* MOSES rev 6 didapatkan model seperti berikut :

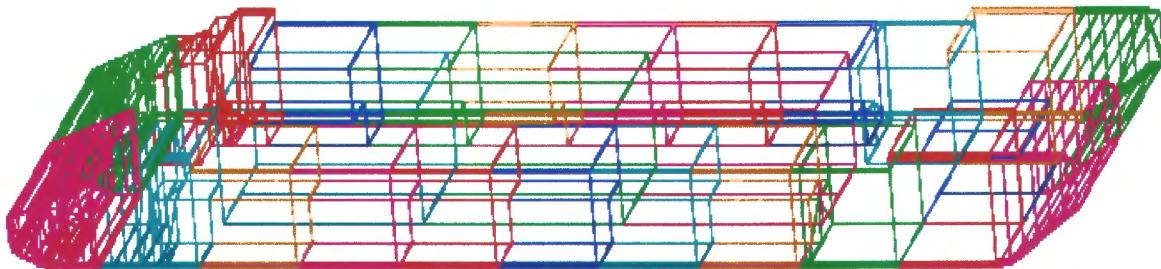

Gambar 4.4. Pemodelan jacket pada MOSES rev.6

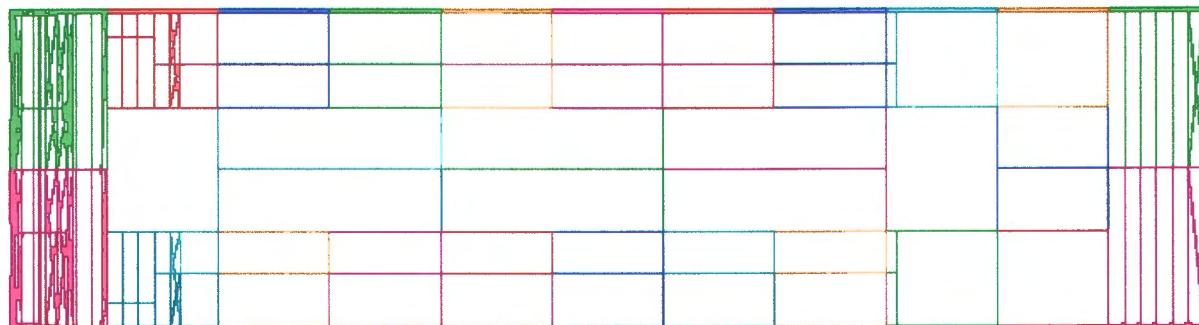

4.2.2. Pemodelan Barge

Launch Barge S-45 digunakan untuk transportasi dan me-*launching jacket*.

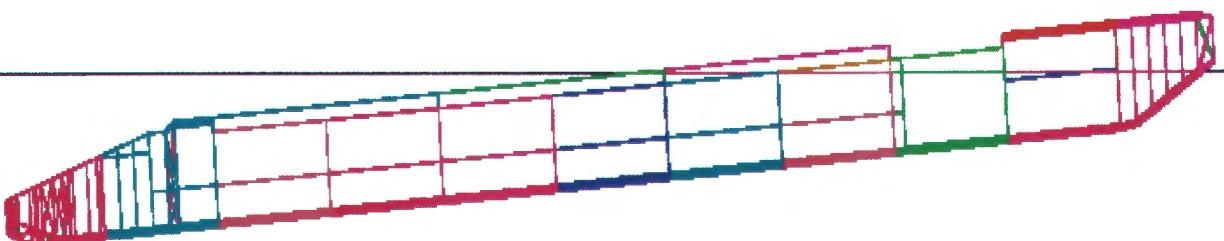

Pemodelan *barge* S-45 dengan menggunakan software MOSES rev. 7, didapatkan model dari barge sebagai berikut :

Gambar 4.5. Barge pandangan isometris

Gambar 4.6. Barge pandangan atas

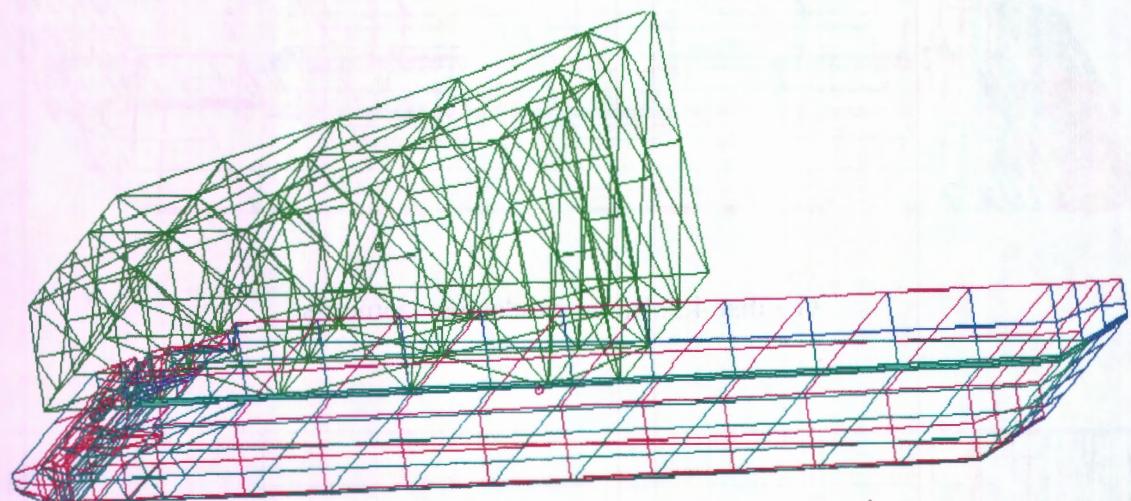

Gambar 4.7. Barge pandangan samping

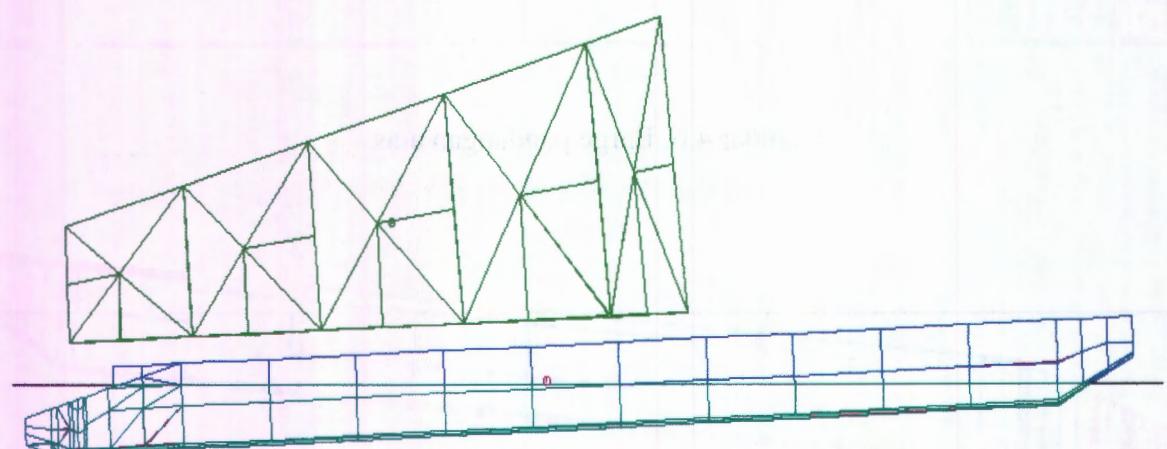

4.2.3. Kondisi awal *launching jacket*

Jacket diletakkan 72.18 meter dari bow pada ketinggian 1.8 meters pada *skid beams*. *Barge* diballast 2.3 meter dengan sudut trim 2.3° sebelum proses launching dilakukan.

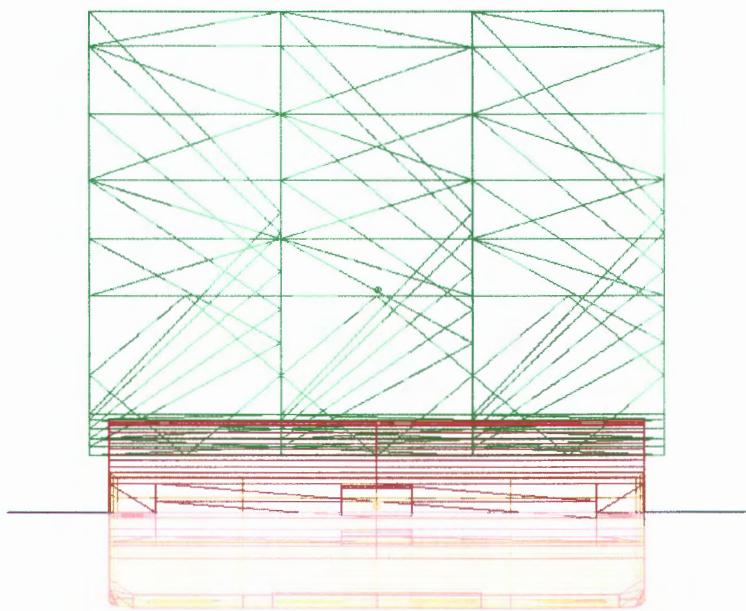

Ilustrasi dibawah menggambarkan posisi *barge* dan *jacket* sebelum proses *launching* dilakukan.

Gambar 4.8. Pandangan isometris kondisi awal *Launching*

Gambar 4.9. Pandangan samping kondisi awal *Launching*

Gambar 4.10. Pandangan depan kondisi awal *Launching*

4.3. Analisa Hasil Perhitungan pada MOSES rev.6

Pemodelan launching jacket pada MOSES rev.6 dibutuhkan waktu 87,5 detik bagi jacket untuk mencapai posisi berosilasi bebas. selama proses *launching jacket* terdapat beberapa tahap kritis yaitu seperti tercantum pada table di bawah ini :

Tabel 4.3. Time simulation *Launching*

4.3.1 Beberapa tahapan dalam proses peluncuran jacket

Dalam proses *launching jacket* terdapat beberapa tahap penting yang menentukan kesuksesan dari instalasi *jacket*, yaitu:

4.3.1.1. Kondisi awal *launching jacket*

Kondisi awal launching jacket di jelaskan pada table di bawah ini.

Tabel 4.4. Kondisi awal *launching*

Waktu	0.00	Sec
Berat jacket	4259.3	M-Tons
Jacket Center of Gravity	72.57 0.00 9.74	M
Jacket Buoyancy =	5542.11	M-Tons
Draft Midships =	2.3	M
Trim Angle By Stern =	2.3	Deg

4.3.1.2. Ketika *Jacket* mengalami *Tipping*

Tahapan kritis selanjutnya adalah saat *Jacket* mengalami *tipping*, kondisi ini dapat dijelaskan seperti table di bawah ini.

Tabel 4.5. Kondisi ketika *jacket* mengalami *tipping*.

Waktu	80.00	Sec
Panjang kaki pada deck	47.31	M
Jacket Center of Gravity	121.2 0.00 7.73	M
Beban Port Rocker	2090	M-Tons
Beban Stbd Rocker	2142	M-Tons
Total beban Rocker	4232	M-Tons
Percent dari berat jacket	99	%
Jacket Trim Angle	3.77	Deg
Barge Trim Angle	3.09	Deg

4.3.1.3. Ketika *Jacket* terlepas (berosilasi)

Tahapan kritis terakhir selama proses peluncuran *jacket* adalah pada saat *jacket* terlepas dari *barge* dan mulai berosilasi bebas. Kondisi ini dijelaskan seperti table di bawah ini.

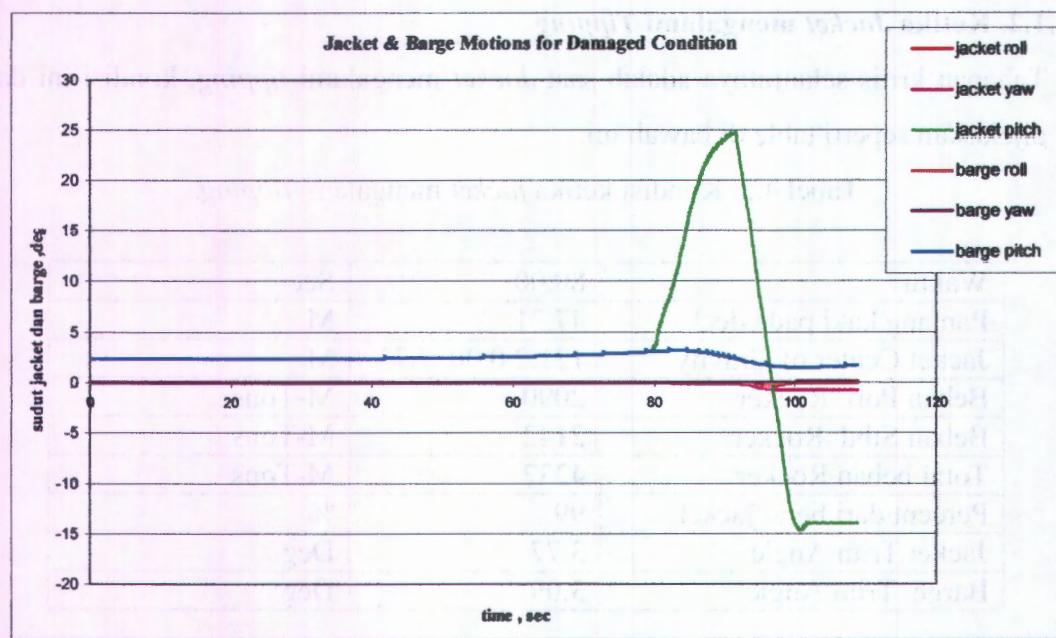

Tabel 4.6. Kondisi ketika *jacket* berosilasi

Waktu	91.25	Sec
Panjang kaki pada deck	0	M
Jacket Center of Gravity	168.7 0.04 2.79	M
Beban Port Rocker	355	M-Tons
Beban Stbd Rocker	367	M-Tons
Total beban Rocker	722	M-Tons
Percent dari berat jacket	16	%
Jacket Trim Angle	24.66	Deg
Barge Trim Angle	2.37	Deg

4.3.2. Pergerakan *barge* dan *Jacket*

Selama proses *launching* dilakukan, *jacket* dan *barge* mengalami pergerakan.

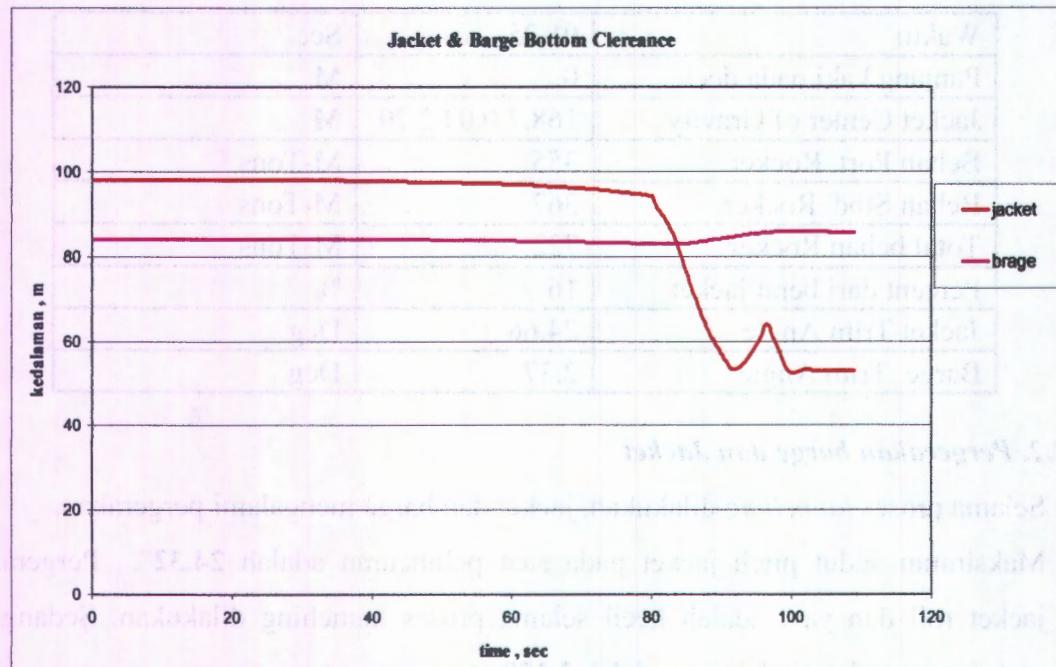

Maksimum sudut pitch *jacket* pada saat peluncuran adalah 24.32° . Pergerakan *jacket* roll dan yaw adalah kecil selama proses launching dilakukan. Sedangkan maksimum sudut pitch *barge* adalah 3.17° .

Gambar 4.11. Grafik pergerakan *barge* dan *jacket*

4.3.3. Jacket Bottom Clearance

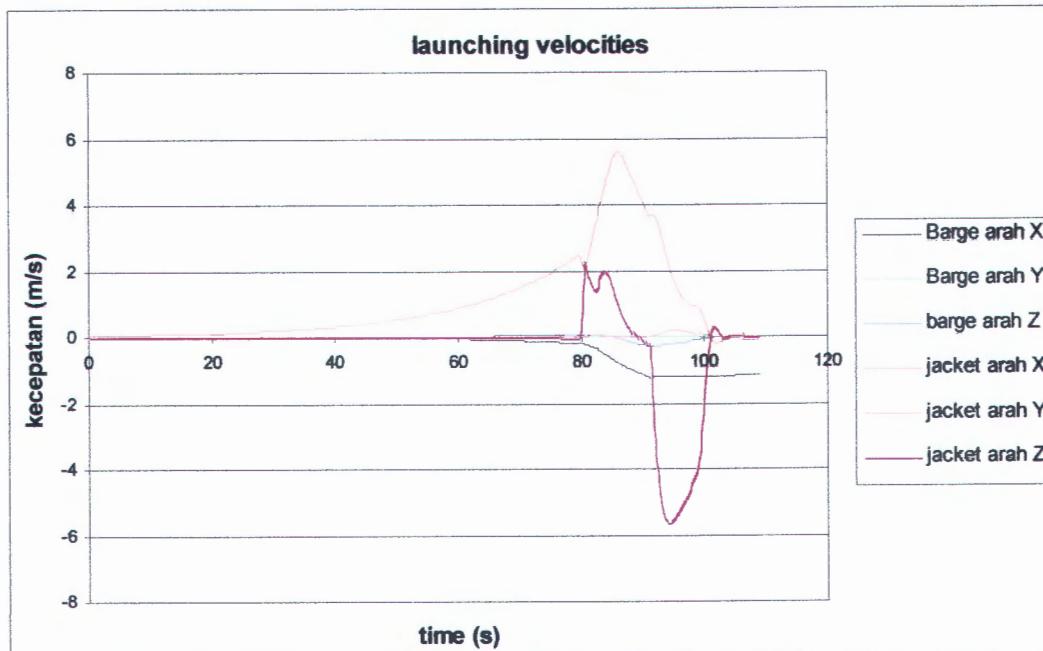

Analisa bottom clearance jacket penting dilakukan, karena saat jacket mulai Jacket tenggelam kurang lebih 40.5 meter setelah terlepas dari barge. Minimum jacket bottom clearance adalah sebesar 53 meter pada kedalaman perairan 93.5 meter. Di bawah ini adalah table bottom clearance jacket dan barge.

Gambar 4.12. Grafik bottom clearence barge dan jacket

4.3.4. Kecepatan Launching

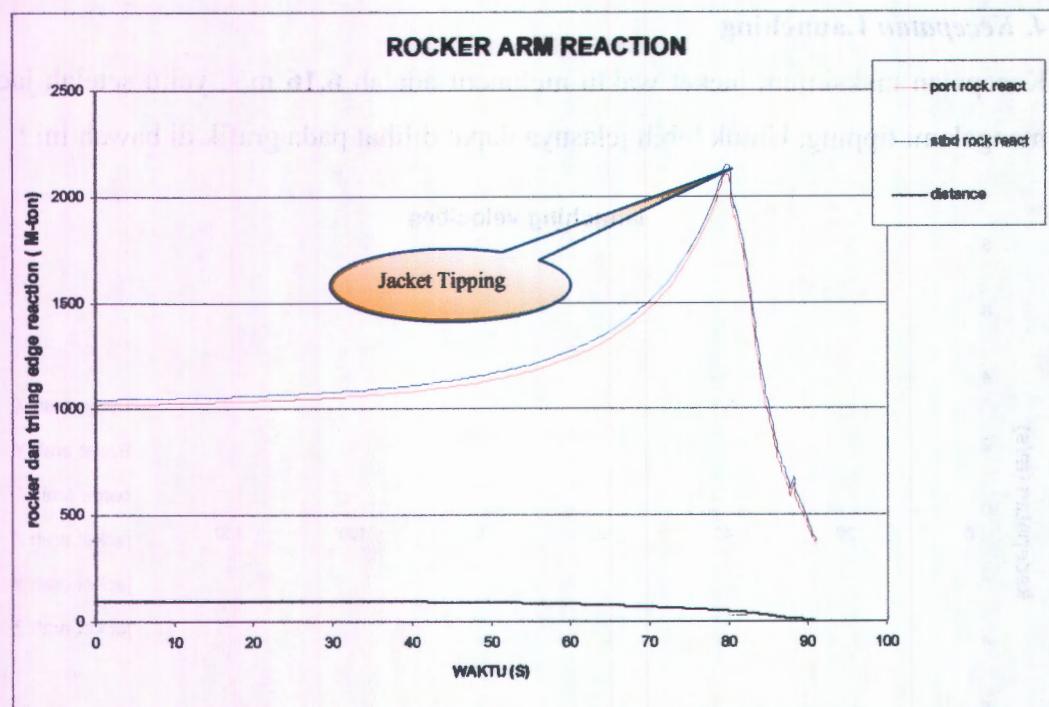

Kecepatan maksimum jacket waktu meluncur adalah **6,16 m/s**, yaitu setelah jacket mengalami tipping. Untuk lebih jelasnya dapat dilihat pada grafik di bawah ini :

Gambar 4.13. Grafik kecepatan *barge* dan *jacket* selama *launching*

4.3.5. Reaksi *Rocker Arm*

Rocker arm adalah konektor yang berguna menghubungkan transport barge dan jacket yang terletak pada stern barge. Gaya akibat berat *jacket* yang bekerja pada *rocker arm* berubah-ubah sesuai dengan sudut kemiringan *jacket*. Gaya terbesar yang terjadi adalah pada saat *jacket* mulai mengalami tipping yaitu sebesar 2090 m-ton pada *portside* dan 2142 m-ton pada *starboard*.

Gambar 4.14. Grafik gaya pada *rocker arm* selama *launching*

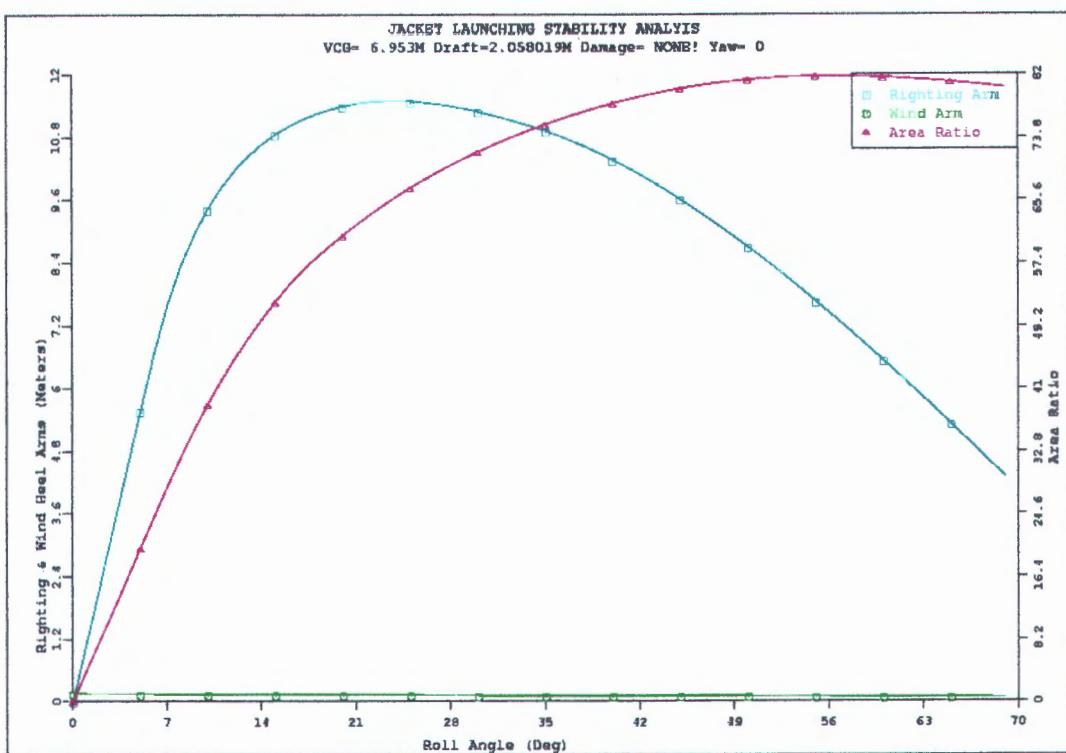

4.4. Analisa stabilitas Barge selama proses peluncuran

Stabilitas dalam penelitian ini yaitu pengecekan jarak titik center of gravity lebih tinggi dari titik bouyancy. Karena adanya muatan jacket, maka tinggi metacentre mengecil menjadi GM' dan jarak dari titik berat menuju keel membesar menjadi KG' .

4.4.1 Stabilitas barge tanpa jacket

Dari hasil running model (barge tanpa jacket) pada MOSES rev.7 maka didapatkan harga righting lever (GZ) lebih besar dari 0,35 meter. Ini berarti barge masih dalam keadaan stabil meskipun mengalami rolling sampai 70° .

Hal ini juga dapat dilihat dari tabel di bawah ini.

Gambar 4.15. Grafik Stabilitas barge

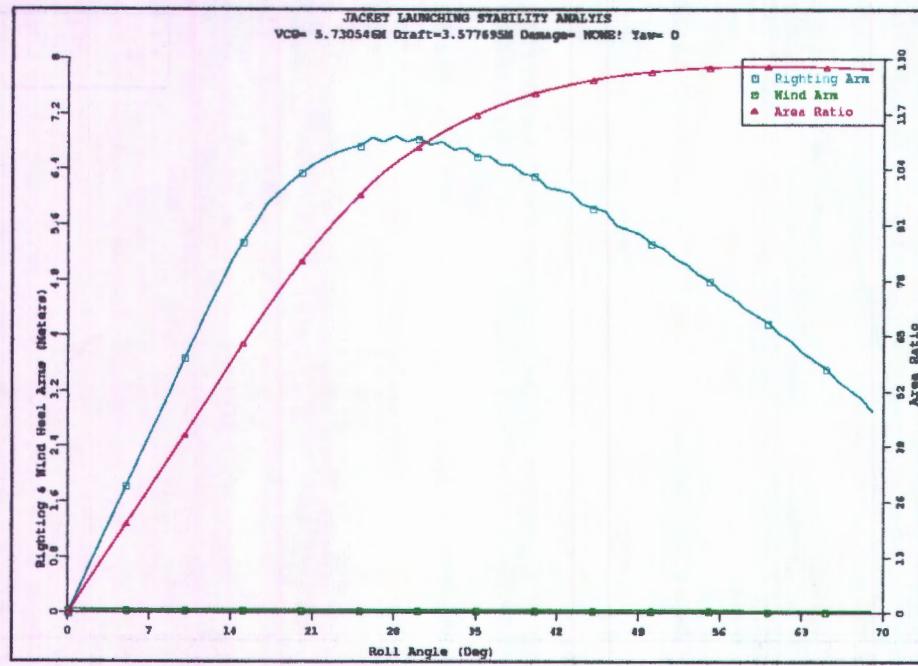

4.4.2 Stabilitas barge dengan jacket

Pengecekan stabilitas pada saat launching dilakukan saat terjadi tahapan kritis selama proses launching dilakukan. yaitu awal launching ($t= 0$ detik), pada saat jacket mengalami tipping ($t= 80$ detik) dan pada saat jacket mulai terpisah dari jacket ($t= 91.25$ detik). Hal ini dikarenakan barge mengalami perubahan letak center of gravity yang signifikan karena ada pergerakan jacket. Perubahan titik berat dan titik bouyancy menyebabkan perubahan harga GM. Bila harga $GM < 0,35$ meter, maka barge tidak stabil.

4.4.2.1 Stabilitas barge dengan jacket pada saat awal launching ($t= 0$ detik)

Pada kondisi awal *launching*, titik berat jacket terletak koordinat 72.52,0.00, 9.74 (x,y,z) pada sistem koordinat barge. Hal ini berarti jacket terletak 72.52 meter dari bow. Dari hasil running MOSES rev.7 didapatkan kurva seperti di bawah ini

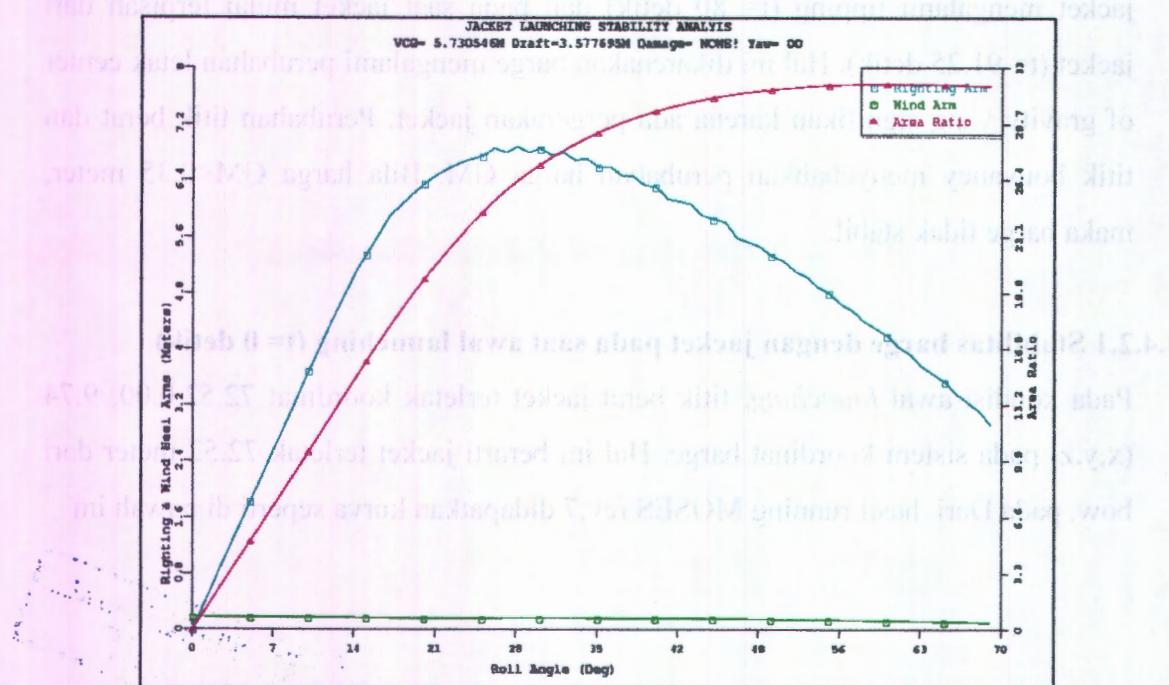

1. Stabilitas untuk arah melintang (rolling)

Gambar 4.16. Grafik Stabilitas melintang barge pada saat $t = 0$ detik

Dari grafik diatas didapatkan *Righting Arm* untuk sudut roll 0.01derajat (mengacu pada hasil running pada software moses) yaitu sebesar 0 m. Berarti barge masih dalam keadaan stabil.

2. Stabilitas untuk arah memanjang (pitching)

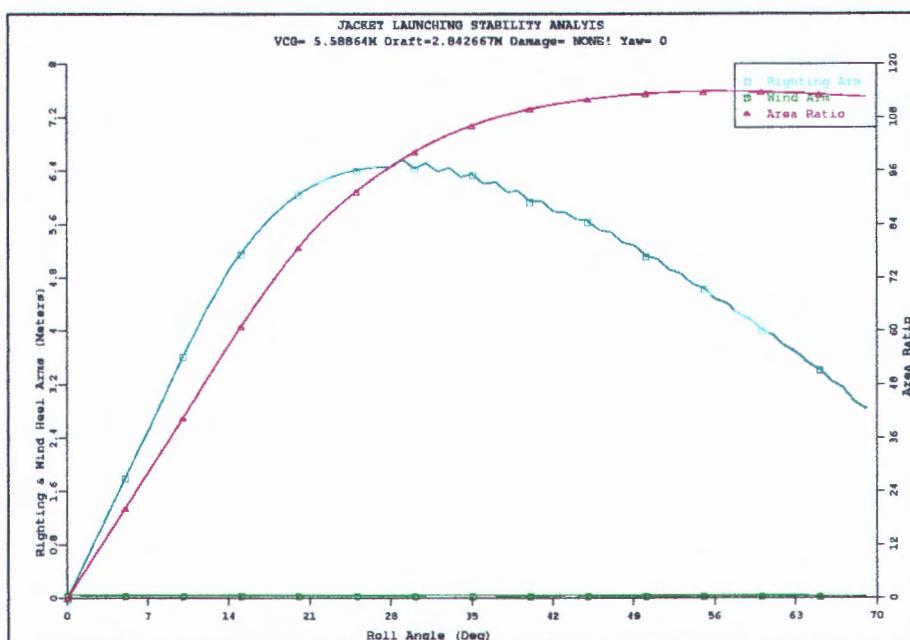

Gambar 4.17. Grafik stabilitas memanjang barge pada saat $t = 0$ detik

Dari grafik diatas didapatkan *Righting Arm* untuk sudut pitch 2.3 derajat (mengacu pada hasil running pada software moses) yaitu sebesar 0.8 m. Berarti barge masih dalam keadaan stabil.

4.4.2.2 Stabilitas barge saat jacket mengalami tipping ($t= 80$ detik)

Pada saat *jacket* mengalami *tipping*, titik berat *jacket* terletak koordinat 102.74, 0.00, 8.29 (x,y,z) pada sistem koordinat barge. Hal ini berarti jacket terletak 102.74 meter dari bow. Dari hasil running MOSES rev.7 didapatkan kurva seperti di bawah ini :

1. Stabilitas untuk arah melintang (rolling)

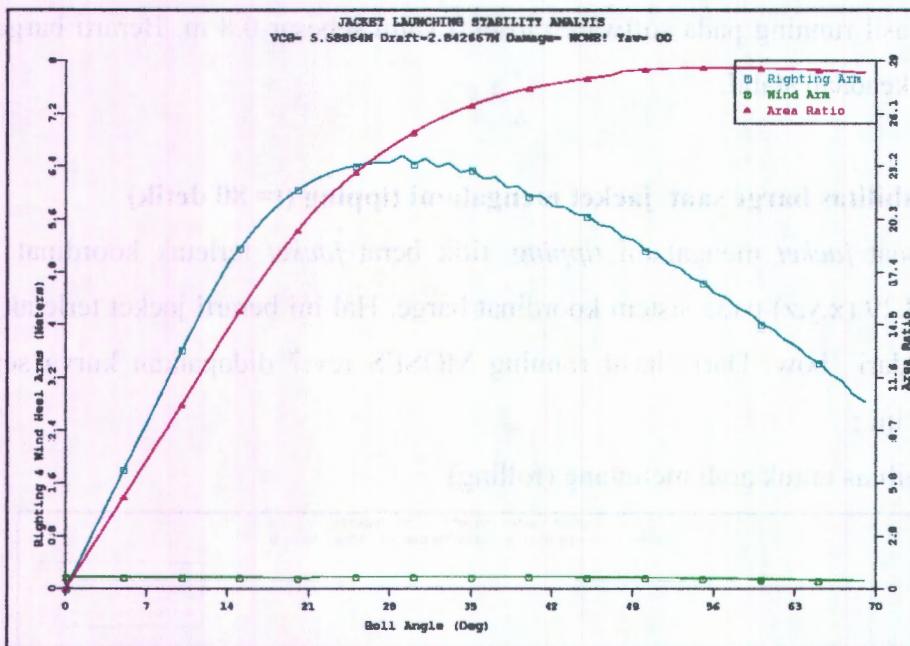

Gambar 4.18. Grafik stabilitas melintang barge pada saat $t = 80$ detik

Dari grafik diatas didapatkan *Righting Arm* untuk sudut roll 0.01 derajat (mengacu pada hasil running pada software moses) yaitu sebesar 0 m. Berarti barge masih dalam keadaan stabil.

2. Stabilitas untuk arah memanjang (pitching)

Gambar 4.19. Grafik. stabilitas memanjang barge pada saat $t = 80$ detik

Dari grafik diatas didapatkan *Righting Arm* untuk sudut pitch 3.09 derajat (mengacu pada hasil running pada software moses) yaitu sebesar 6.16 m. Berarti barge masih dalam keadaan stabil.

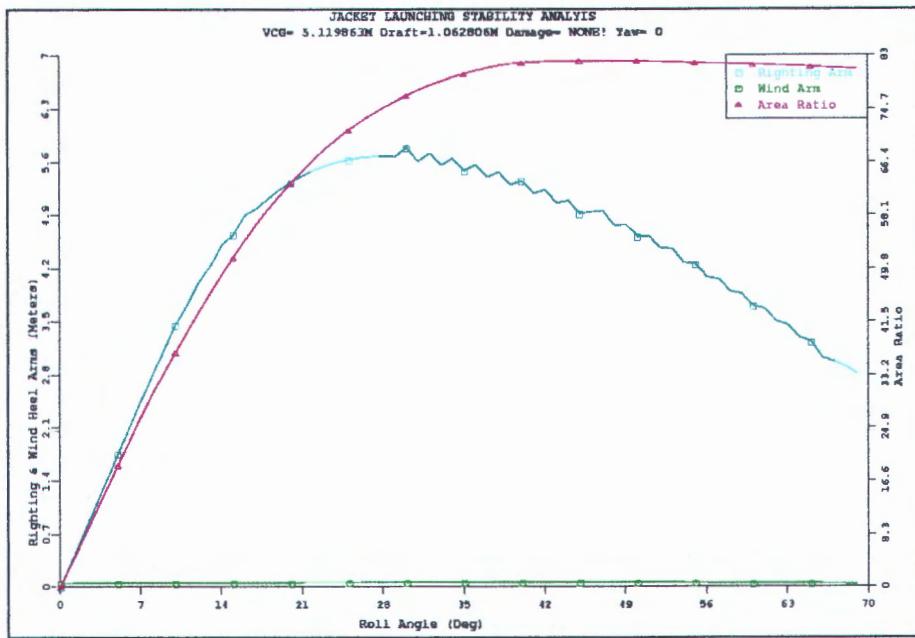

4.4.2.3 Stabilitas barge saat jacket mulai terpisah dari barge ($t = 91.25$ detik)

Pada saat *jacket* akan terpisah dari *barge* maka perpindahan titik berat *jacket* terletak pada ujung rocker arm. Titik berat *jacket* terletak koordinat 168, 0.04, 3.5 (x,y,z) pada sistem koordinat barge.

Dari hasil running MOSES rev.7 didapatkan kurva seperti di bawah ini :

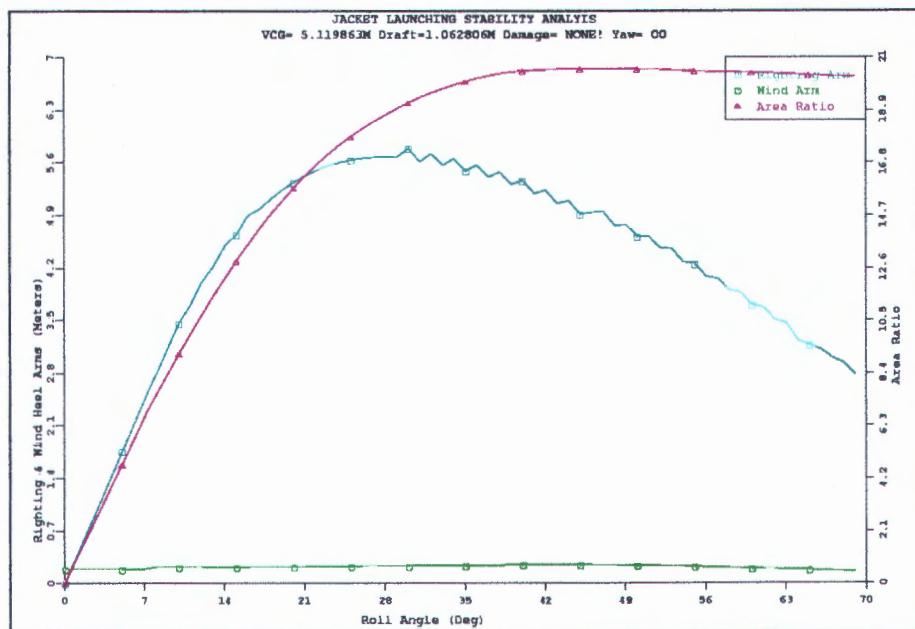

1. Stabilitas untuk arah melintang (rolling)

Gambar 4.20. Grafik. stabilitas melintang barge pada saat $t = 91.25$ detik

Dari grafik diatas didapatkan *Righting Arm* untuk sudut rolling barge 0.02 (mengacu pada hasil running pada software moses) yaitu sebesar 0 m. Berarti barge masih dalam keadaan stabil.

2. Stabilitas untuk arah memanjang (pitching)

Gambar 4.21. Grafik stabilitas memanjang barge pada saat $t = 91.25$ detik

Dari grafik diatas dapat diketahui harga GZ untuk sudut pitch 2,37 derajat (mengacu pada hasil running pada software moses) yaitu sebesar 5,66 m. Berarti barge masih dalam keadaan stabil.

4.5. Validasi

Setelah melakukan analisa launching jacket dan stabilitas barge, perlu dilakukan validasi terhadap hasil yang diperoleh. Validasi yang dilakukan adalah dengan membandingkan dengan penelitian yang dilakukan sebelumnya. Dari penelitian yang telah dilakukan sebelumnya didapatkan sudut maksimum pitch jacket adalah sebesar $24,6^\circ$ dan sudut maksimum pitch barge sebesar 5° . Kecepatan maksimum jacket saat launching sebesar 4,05 m/s pada penelitian sebelumnya, sedangkan pada penelitian ini adalah 6,16 m/s. jacket bottom clearance sebesar 42,6 m , sedangkan pada penelitian ini 52,4 m. Reaksi rocker arm saat jacket tipping sebesar 2,276 metric-ton untuk starboard dan 2,088 metric-ton untuk portside. Sedangkan pada penelitian, reaksi rocker arm saat jacket tipping sebesar 2090 metric-ton untuk starboard dan 2142 metric-ton untuk portside.

Perbedaan sudut maksimum pitch barge dikarenakan adanya perbedaan sudut trim pada waktu kondisi awal peluncuran jacket. Pada penelitian ini sudut trim awal peluncuran jacket adalah $2,3^\circ$, sedangkan pada penelitian sebelumnya adalah $4,25^\circ$. Adanya perbedaan kecepatan jacket, bottom clearance dan reaksi rocker arm dikarenakan adanya perbedaan model jacket yang diluncurkan (berat dan dimensi jacket).

BAB V

KESIMPULAN DAN SARAN

5.1. Kesimpulan

Beberapa kesimpulan yang dapat diambil dari analisa yang telah dilakukan adalah sebagai berikut:

1. Dari hasil analisa , dapat disimpulkan the LD22-1 CEP *jacket* dapat dengan sukses diluncurkan. Minimum bottom clearance *jacket* adalah sebesar 53 meter dengan kedalaman laut 93.5 meter. Berarti *jacket* tidak mengalami kerusakan yang diakibatkan karena menyentuh dasar laut. Kecepatan maksimum *jacket* saat peluncuran adalah 6,16 m/s arah sumbu x global.
2. Total reaksi terbesar dari kedua rocker beam (port dan starboard) adalah sebesar 4232 m-ton atau 99% dari berat total *jacket*. Jadi dapat diambil kesimpulan bahwa rocker arm masih aman selama proses *launching* berlangsung.
3. Stabilitas *barge* dapat dikatakan aman, karena harga *righting arm* dan *heeling arm* baik untuk *rolling* maupun *pitching* pada saat *jacket* mengalami *tipping* dan mulai berosilasi masih lebih besar dari nol. Hal ini berarti *barge* masih stabil walaupun ada perubahan titik berat *jacket* yang cukup signifikan selama peluncuran .

5.2. Saran

Beberapa hal yang dapat dijadikan saran yang sifatnya membangun penulisan Tugas Akhir ini adalah sebagai berikut:

1. Untuk penelitian selanjutnya perlu dilakukan penelitian tentang stabilitas *barge* dengan beberapa variasi berat *jacket* dan variasi dimensi *barge* sehingga dapat diketahui *launching barge* yang sesuai dengan berat *jacket* dengan mengacu kepada stabilitas *barge*.
2. Perlu dilakukan penelitian tentang launching dengan menggunakan software MOSES dengan tingkatan yang lebih tinggi daripada software MOSES yang digunakan oleh peneliti (MOSES rev.6).

+++ S T A B I L I T Y S U M M A R Y +++

The Following Intact Condition

=====

Draft = 1.06 M

Roll = -0.43 Deg

Pitch = 3.19 Deg

VCG = 5.12 M

Axis Angle = 0.00 Deg

Wind Vel = 50.00 Knots

Passes All of The Stability Requirements:

=====

Area Ratio >= 1.40

RA/HA Ratio >= 0.00

Dfld Height @ Equilibrium	>=	0.00 M
GM	>=	0.15 M
Arm Area @ Max Right. Arm	>=	4.58 M*Deg
Arm Area @ Dfld	>=	0.00 M*Deg
Arm Area @ 40 Degrees	>=	5.16 M*Deg
Area Under Righting Arm	>=	0.00 M*Deg
Static Heel w/o Wind	<=	90.00 Deg
Static Heel Due to Wind	<=	90.00 Deg
Range (Second Intercept)	>=	0.00 Deg
2nd - 1st Intercepts	>=	0.00 Deg
Dfld Angle - 1st Interc.	>=	0.00 Deg
Angle @ Max Righting Arm	>=	15.00 Deg
Downflood Angle	>=	0.00 Deg

With The Stability Results:

Area Ratio	=	80.95	Passes
RA/HA Ratio	=	103.89	Passes
Dfld Height @ Equilibrium	=	0.00 M	Passes
GM	=	19.97 M	Passes
Arm Area @ Max Right Arm	=	119.07 M*Deg	Passes
Arm Area @ Dfld	=	295.77 M*Deg	Passes
Arm Area @ 40 Degrees	=	174.43 M*Deg	Passes
Area Under Righting Arm	=	295.77 M*Deg	Passes
Static Heel w/o Wind	=	-0.43 Deg	Passes
Static Heel Due to Wind	=	-0.30 Deg	Passes
Range	=	69.00 Deg	Passes
2nd - 1st Intercepts	=	68.87 Deg	Passes
Dfld Angle - 1st Interc.	=	68.87 Deg	Passes
Angle @ Max Right Arm	=	30.00 Deg	Passes
Downflood Angle	=	68.57 Deg	Passes

BIODATA PENULIS

Dhani Fayumi Asyhar dilahirkan di Malang, 22 Nopember 1984. Merupakan anak ke-dua dari 2 bersaudara. Pendidikan dari SD sampai SLTP dilakukan di Malang dan lulus tahun 2000. Kemudian penulis melanjutkan sekolah di SMU Negeri 3 Malang. Lulus dari SMU pada tahun 2003, setelah itu penulis mengikuti Ujian Masuk Perguruan Tinggi Negeri (UMPTN) dan diterima di Jurusan Teknik Kelautan, Fakultas Teknologi Kelautan, Institut Teknologi Sepuluh Nopember pada tahun 2003 dan terdaftar dengan NRP 4303.100.014.

Selama kuliah penulis aktif di beberapa organisasi kemahasiswaan kampus. Penulis juga aktif di berbagai kegiatan sebagai panitia maupun peserta. Berbagai pelatihan dan seminar pernah diikutinya dalam rangka untuk pengembangan dirinya. Pada tahun 2005 penulis menjabat sebagai pengurus HIMATEKLA departemen HUMAS dan pada tahun 2006 sebagai sekertaris UKM SKATEBOARDING ITS. Saat ini penulis tengah menekuni salah satu bidang keahlian di Jurusan Teknik Kelautan, yaitu bidang Hidrodinamika Bangunan Lepas Pantai.
