**ABSTRAK**

PT. Terminal Petikemas Surabaya (TPS) merupakan salah satu terminal petikemas utama di Indonesia untuk melayani perdagangan domestik maupun internasional khususnya untuk wilayah bagian Timur Indonesia. PT. TPS berencana mengembangkan kapasitas operasional dermaganya. Direncanakan kapasitas kapal petikemas yang bisa dilayani adalah sampai dengan 60.000 DWT. Korosi yang mengakibatkan berkurangnya ketebalan baja *Mooring Bollard* dan anchor dapat menurunkan kemampuan, kapasitas dan daya dukung mooring bollard tersebut. Maka kekuatan dan daya dukung mooring bollard perlu diperhatikan. Penelitian ini bertujuan untuk menganalisa kekuatan *Bollard* terkorosi yang berada di dermaga Terminal Petikemas Surabaya (PT.TPS) dalam kondisi operasi dan dalam kondisi badai. Berdasarkan data dari PT.TPS, *Bollard* mengalami penipisan ketebalan hingga mencapai ketebalan rata-rata 25 mm. Sehingga didapatkan kesimpulan dalam penelitian Tugas Akhir ini berupa Besar nilai *Safety Factor* dari *Bollard* terkorosi, berdasarkan besar kekuatan sisa *Yield Stress* material *Bollard* dibagi dengan *Actual Stress* yang terjadi adalah 2.45 pada kondisi operasi dan 0.93 pada kondisi badai. Sehingga *Bollard* terkorosi dengan ketebalan rata-rata 25 mm **Aman** untuk digunakan dalam kondisi operasi sementara untuk kondisi badai *Bollard* terkorosi dengan ketebalan rata-rata 25 mm **Tidak Aman** untuk digunakan.

**Kata Kunci** : *Mooring*, Pelabuhan, *Bollard*, Korosi, *Safety Factor*, PT.TPS.

### ABSTRACT

PT. Surabaya Petikemas Terminal (TPS) is one of the main container terminals in Indonesia to serve both domestic and international trade especially for Eastern part of Indonesia. PT. TPS plans to expand its dock operational capacity. It is estimated that the capacity of container ships that can be served is up to 60,000 DWT. Corrosion resulting in reduced steel thickness of Mooring Bollard and anchor can decrease the ability, capacity and carrying capacity of the mooring bollard. The strength and carrying capacity of the mooring bollard should be analyzed. This study aims to analyze the strength of corroded Bollard located at the Terminal Petikemas Surabaya (PT.TPS) dock in operating conditions and in storm conditions. Based on data from PT.TPS, Bollard experienced thinning of the furniture to reach an average thickness of 25 mm. So the conclusion of this research is in the form of Value of Safety Factor from corroded bollard. Based on the remaining strength of Yield Stress Bollard material divided by Actual Stress that happened is 2.45 at operating condition and 0.93 in storm condition. Thus Bollard corroded with an average thickness of 25 mm Safe to use in temporary operating conditions for storm conditions Bollard corroded with an average thickness of 25 mm Not Safe to use.

**Key word** – mooring, dock, bollard, corrosion, safety factor, PT. TPS

## KATA PENGANTAR

Puji syukur Alhamdulillah penulis ucapkan kepada Tuhan Yesus Kristus yang telah memberikan rahmat dan karuniaNya sehingga penulis dapat menyelesaikan laporan akhir Tugas Akhir dengan judul “Studi Analisis Assesment Kekuatan *Bollard* Terkorosi di Dermaga Terminal Petikemas Surabaya (PT. TPS)”.

Tugas Akhir ini merupakan salah satu syarat dalam menyelesaikan Studi Kesarjanaan (S-1) di Jurusan Teknik Kelautan, Fakultas Teknologi Kelautan, Institut Teknologi Sepuluh Nopember Surabaya. Tugas Akhir ini membahas tentang analisa kekuatan dari salah *Mooring Equipment* yang ada di pelabuhan yaitu *Bollard*, namun dalam kondisi *Bollard* tersebut terkorosi.

Penulis menyadari bahwa masih banyak kekurangan dari laporan ini, baik dari materi maupun teknik penyajiannya mengingat kurangnya pengetahuan dan pengalaman penulis. Oleh karena itu, kritik dan saran yang membangun sangat penulis harapkan.

Untuk itu semoga dalam laporan Tugas Akhir ini dapat bermanfaat dan juga dapat menambah ilmu pengetahuan yang terkait bagi para pembaca.

Surabaya, 2017

Agung Setya Wicaksana

## UCAPAN TERIMAKASIH

Pada kesempatan kali ini, Penulis menyampaikan terimakasih kepada semua pihak yang telah membantu dalam menyelesaikan Tugas akhir ini baik dukungan secara moril dan materi, diantaranya kepada :

1. Tuhan Yesus Kristus atas semua keberkahan dan kemudahan dalam mengerjakan dan menyelesaikan Tugas Akhir ini.
2. Kedua Orang tua, kakak serta adik penulis yang secara tulus ikhlas memberikan doa dan dukungan sehingga Tugas Akhir ini dapat selesai dengan lancar.
3. Bapak Dr. Eng. Yeyes Mulyadi, S.T., M.Sc selaku dosen pembimbing I yang telah memberikan ilmu dan pebimbingan dalam penyelesaian Tugas Akhir
4. Bapak Nur Syahroni S.T.,M.T.,Ph.D. selaku dosen pembimbing II yang telah memberikan ilmu dan pebimbingan dalam penyelesaian Tugas Akhir
5. Bapak Yoyok Setyo H., S.T., M.T., Ph.D, selaku dosen wali selama masa perkuliahan di ITS – Surabaya
6. Bapak-bapak dosen penguji selama proses sidang proposal sampai sidang akhir berlangsung.
7. Kepada Auliya Aldi, Enggar, Rizqi August, Mas Hamzah, Sandy, Faisal, Zulwaqor, Farrel, Vito, Erras, Fiqhi, Aris, Fajar, Bayu, Fajri, Prasetyo, Nuraksatra karena telah membantu dan menyemangati penulis.
8. Teman-teman sejawat angkatan 2012 (Varuna) Teknik Kelautan ITS.
9. Teman-teman dari Laboratorioum OPRES yang selalu menemani penulis selama mengerjakan Tugas Akhir ini.
10. Teman-teman Paguyuban Kota Bogor SAFARY yang selalu menemani penulis.

Ucapan terima kasih juga saya sampaikan kepada seluruh pihak yang secara langsung maupun tak langsung turut membantu dalam menyelesaikan Tugas Akhir ini.

*(halaman sengaja dikosongkan)*

# BAB I

## PENDAHULUAN

### 1.1 LATAR BELAKANG

Dermaga adalah bangunan di tepi laut (sungai, danau) yang berfungsi untuk melayani kapal, dalam bongkar/muat barang dan atau menaikkan/menurunkan penumpang (Asiyanto, 2008).

Dermaga dapat dibedakan menjadi dua tipe yaitu *Wharf* atau *Quai* dan *Jetty* atau *Pier* atau jembatan. *Wharf* adalah dermaga paralel dengan pantai dan biasanya berimpit dengan garis pantai. *Jetty* atau *Pier* adalah dermaga yang menjorok ke laut (Bambang, 2009).

Dalam menjalankan fungsinya, dermaga dibantu oleh beberapa alat atau sarana pendukung. Contohnya dalam dermaga yang berfungsi sebagai transportasi massal, dibutuhkan jembatan penumpang, lahan parkir dan lain-lain. Namun dalam menjalankan fungsinya, dermaga akan selalu membutuhkan sistem penambatan (*Mooring*).

PT. Terminal Petikemas Surabaya (TPS) merupakan salah satu terminal petikemas utama di Indonesia untuk melayani perdagangan domestik maupun internasional khususnya untuk wilayah bagian Timur Indonesia.

PT. TPS memiliki fasilitas utama berupa dermaga yang terdiri dari dermaga domestik sepanjang 600 m dan dermaga internasional sepanjang 1000 m seperti pada Gambar 1.1. PT. TPS berlokasi di bagian barat Pelabuhan Tanjung Perak, di bagian ujung alur pelayaran di antara pulau Jawa dan pulau Madura sepanjang 25 mil. Dermaga domestik berukuran 450 m, lebar 40 m dan kedalaman 7.5 m. Sedangkan dermaga internasional berukuran panjang 1000 m, lebar 50 m dan kedalaman 10.5 m.

Untuk mendukung fungsi dari dermaga milik PT Terminal Petikemas Surabaya (TPS), dermaga tersebut dibantu oleh sistem tambat berupa *Mooring Bollard*

(Gambar 1.2). *Mooring Bollard* merupakan sarana penopang proses penambatan yang esensial, dimana *mooring bollard* merupakan fasilitas dimana tali tambat kapal ditambatkan pada dermaga.

Gambar 1.1 Dermaga Terminal Petikemas Surabaya

*Mooring bollard* memiliki konstruksi penopang berupa *Anchor*. *Anchor* ini berupa mur yang mengikat baut mooring bollard untuk menjaga kestabilan dan kekuatan *Mooring Bollard* agar tidak terjadi dislokasi dan deformasi struktur *Mooring Bollard*.

Gambar 1.2 *Bollard* Pada Dermaga Domestik PT. Terminal Petikemas Surabaya

Dengan semakin berkembangnya perdagangan domestik maupun internasional, terjadi peningkatan secara signifikan pengiriman barang melalui petikemas. Untuk mengantisipasi hal tersebut, maka PT. TPS berencana mengembangkan kapasitas operasional dermaganya. Direncanakan kapasitas kapal petikemas yang bisa dilayani adalah sampai dengan 60.000 DWT.

Korosi yang mengakibatkan berkurangnya ketebalan baja mooring bollard dan anchor dapat menurunkan kemampuan, kapasitas dan daya dukung mooring bollard tersebut. Berkaitan dengan rencana operasional PT.TPS kedepannya yang akan menerima proses pekerjaan bongkar muat kapal 60.000 DWT, maka kekuatan dan daya dukung mooring bollard perlu diperhatikan agar dapat mengakomodasi besarnya penambahan kapasitas kapal tersebut.

## **1.2 RUMUSAN MASALAH**

Permasalahan yang di bahas pada penelitian tugas akhir ini adalah :

1. Berapa besar *Line Tension* maksimum yang terjadi pada *Mooring Line*?
2. Bagaimana respon *Mooring Bollard* (*Stress*, *Strain* dan deformasi) terkorosi saat menerima *Line Tension* maksimum?
3. Berapa besar *Safety Factor* yang terjadi pada struktur *Bollard* yang terkorosi?

## **1.3 TUJUAN**

Adapun tujuan yang dicapai dalam penelitian tugas akhir ini adalah

1. Mengetahui besar *Line Tension* maksimum yang terjadi pada *Mooring Line*.
2. Mengetahui respon *Mooring Bollard* (*Stress*, *Strain* dan deformasi) terkorosi saat menerima *Line Tension* maksimum.
3. Mengetahui besar *Safety Factor* yang terjadi pada struktur *Bollard* yang terkorosi.

## **1.4 MANFAAT**

Hasil penelitian dari pengerjaan Tugas Akhir ini diharapkan menjadi informasi mengenai data-data yang akan dicari sesuai rumusan masalah diatas dan dapat menjadi referensi bagi perusahaan, lembaga penelitian atau instansi lain yang terkait

maupun pihak *Independent* serta mahasiswa yang membutuhkan dan memiliki studi kasus yang sama atau hampir sama dengan penelitian dalam studi Tugas Akhir ini.

### **1.5 BATASAN MASALAH**

Untuk memfokuskan ruang lingkup dari permasalahan yang telah dijabarkan di atas, maka permasalahan akan dibatasi pada hal-hal berikut:

1. Kapal yang dikaji adalah kapal dengan DWT (*Dead Weight Tonnage*) 60.000 DWT.
2. Jenis *Mooring Bollard* yang dikaji merupakan *Mooring Bollard* tipe *T-Head Bollard* dengan kapasitas 150 ton dalam keadaan terkorosi dengan ketebalan *Bollard* sesuai dengan laporan sebelumnya.
3. Arah pembebanan gelombang yang dikaji adalah dari arah  $0^\circ$ ,  $45^\circ$ ,  $90^\circ$ ,  $135^\circ$ , dan  $180^\circ$ .
4. Pasang dan surut diabaikan
5. Kondisi pembebanan dibagi menjadi 2 yaitu kondisi operasi dan badai dimana dalam kondisi pembebanan tersebut tidak terjadi bongkar muat dan kapal sedang bersandar.
6. Kondisi muatan yang dikaji adalah *Full Load*
7. Tipe tali tambat yang digunakan adalah *Nylon Hawser*.

### **1.6 SISTEMATIKA PENULISAN**

Sistematika penulisan yang digunakan dalam laporan kerja praktik adalah sebagai berikut :

1. BAB I Pendahuluan  
Berisi tentang latar belakang, rumusan masalah, tujuan, manfaat, batasan masalah dan sistematika penulisan penelitian.
2. BAB II Dasar Teori  
Berisi tentang studi literature dan dasar teori yang digunakan sebagai dasar dalam pengerjaan tugas akhir ini.
3. BAB III Metodologi Penelitian  
Berisi tentang alur pengerjaan dan metodologi yang dipakai dalam mengerjakan tugas akhir ini.

4. BAB IV Analisa dan Pembahasan

Berisi tentang pembahasan dan hasil dari analisa yang dilakukan serta sudah disesuaikan dengan metode penelitian dan dasar teori yang ada.

5. BAB V Kesimpulan

Berisi tentang kesimpulan yang didapatkan dari hasil analisa dan pembahasan dalam penelitian tugas akhir ini.

6. Daftar Pustaka

Berisi tentang daftar tinjauan atau referensi terkait yang digunakan dalam pembuatan tugas akhir ini.

7. Lampiran

Berisikan data atau informasi terkait yang turut digunakan dalam penyusunan tugas akhir ini.

## BAB II

### TINJAUAN PUSTAKA DAN DASAR TEORI

#### 2.1 TINJAUAN PUSTAKA

Menurut *Oil Companies International Marine Forum* (OCIMF) dalam bukunya ”*Mooring Equipment Guidance*”, sistem pertambatan (*Mooring System*) adalah sistem keamanan yang diterapkan ketika kapal sedang berlabuh. Biasanya tempat berlabuh sebuah kapal tanker adalah pelabuhan dan pulau.

Pengoperasian kapal yang berfungsi sebagai tambatan seperti *Single Point Mooring* (SPM), *Multi-Bouy Moorings* (MBM), *Floating Production, Storage and Offloading Vessels*, *Emergency Towing*, *Tug Handling*, *Barge Mooring*, *Canal Transit*, *Ship-to-Ship Transfer* masih termasuk dalam kategori sistem pertambatan. dan memerlukan klasifikasi tertentu.

Gambar 2.1 Sistem *Mooring* Pada Tanker Terminal (OCIMF, 2008)

Sistem pertambatan terbagi menjadi 2 jenis yaitu *Fixed Mooring* (terpancang) dan *Fleet Mooring*. *Fixed Mooring* terdiri dari elemen struktural, secara permanen tertancap. Elemen struktural termasuk *Platform, Cells, Dolphins, Spuds* (Gambar 2.1). Biasanya *Fixed Mooring* terdapat tali, katrol dan lain-lain. Sementara itu *Fleet Mooring* terdiri dari elemen struktural dan tidak permanen tertancap. (*Naval Facilities Engineering Command, 1986*).

*Bollard* (Gambar 2.2) berbentuk pendek dan memiliki *Column* berbahan dasar baja dengan dasarnya adalah plat. *Bollard* berfungsi untuk sebagai tambatan tali tambat dari struktur tertentu. *Bollard* memiliki berbagai macam bentuk dan memiliki berbagai kapasitas beban penahannya (*Naval Facilities Engineering Command, 1986*).

Gambar 2.2 Spesifikasi *T-Head Bollard*

## 2.2 DASAR TEORI

### 2.2.1 Teori Dasar Gerak Bangunan Laut

Pada dasarnya benda yang mengapung mempunyai 6 mode gerakan bebas yang terbagi menjadi dua kelompok, yaitu 3 mode gerakan translasional dan 3 mode gerakan rotasional. Berikut adalah keenam mode gerakan tersebut dengan ilustrasi yang dapat dilihat pada Gambar 2.3.

1. Mode gerak translasional

- Surge, gerakan transversal arah sumbu x
- Sway, gerakan transversal arah sumbu y
- Heave, gerakan transversal arah sumbu z

2. Mode gerak rotasional

- Roll, gerakan rotasional arah sumbu x
- Pitch, gerakan rotasional arah sumbu y
- Yaw, gerakan rotasional arah sumbu z

Definisi gerakan bangunan laut dalam enam derajat kebebasan dapat dijelaskan dengan Gambar. 2.3. Dengan memakai konversi sumbu tangan kanan tiga gerakan translasi pada arah sumbu x,y dan z, adalah masing-masing *surge* ( $\zeta_1$ ), *sway* ( $\zeta_2$ ) dan *heave* ( $\zeta_3$ ), sedangkan untuk gerakan rotasi terhadap ketiga sumbu adalah *roll* ( $\zeta_4$ ), *pitch* ( $\zeta_5$ ) dan *yaw* ( $\zeta_6$ ).

Gambar 2.3 *Six Degrees of Freedom of Vessel* (Allen, 2006)

Dengan asumsi bahwa gerakan-gerakan osilasi tersebut adalah linier dan harmonik, maka enam persamaan diferensial gerakan kopel dapat dituliskan sebagai berikut :

$$\sum_{n=1}^6 [(M_{jk} + A_{jk})\zeta_k + B_{jk}\zeta_k + C_{jk}\zeta_k] = F_j e^{i\omega t}, j = 1 \quad (2.1)$$

Dengan,

$M_{jk}$  = matriks massa dan momen inersia massa bangunan laut,

$A_{jk}$  = matriks koefisien-koefisien massa tambah hidrodinamik,

$B_{jk}$  = matriks koefisien-koefisien redaman hidrodinamik,

$C_{jk}$  = matriks koefisien-koefisien kekakuan atau gaya dan momen hidrostatis,

$F_j$  = matriks gaya eksitasi ( $F_1, F_2, F_3$ ) dan momen eksitasi ( $M_4, M_5, M_6$ ) dalam fungsi kompleks (dinyatakan oleh  $e$ ),

$F_1$  = gaya eksitasi yang menyebabkan gerakan *surge*,

$F_2$  = gaya eksitasi yang menyebabkan gerakan *sway*,

$F_3$  = gaya eksitasi yang menyebabkan gerakan *heave*,

$M_4$  = momen eksitasi yang menyebabkan gerakan *roll*,

$M_5$  = momen eksitasi yang menyebabkan gerakan *pitch*,

$M_6$  = momen eksitasi yang menyebabkan gerakan *yaw*,

$\zeta_k$  = elevasi gerakan pada moda ke  $k$ ,

$\dot{\zeta}_k$  = elevasi kecepatan gerak pada moda ke  $k$ ,

$\ddot{\zeta}_k$  = elevasi percepatan gerak pada moda ke  $k$ .

Langkah berikutnya dalam menyelesaikan persamaan gerak adalah menentukan harga koefisien-koefisien massa tambah, redaman dan hidrostatis. Dari persamaan gerak ini didapatkan hasil berupa karakteristik gerakan kapal. Informasi ini pada umumnya disajikan dalam bentuk grafik, di mana perbandingan gerakan pada mode tertentu  $\zeta_j$  dengan parameter tinggi (atau amplitudo gelombang,  $\zeta a$ ) diberikan sebagai fungsi frekuensi encounter  $\omega_e$  dari sumber eksitasi.

### 2.2.2 Response Amplitude Operators (RAO)

Setelah menjelaskan dengan seksama tentang teori gerakan bangunan laut, pada akhirnya hasil yang diperlukan oleh perancang, serta pada tahap tertentu oleh operator, adalah informasi tentang karakteristik gerakan itu sendiri. Informasi ini pada umumnya disajikan dalam bentuk grafik, dimana absisnya adalah berupa parameter frekuensi, sedangkan ordinatnya adalah merupakan rasio antara amplitude

gerakan pada metode tertentu,  $\zeta_{ko}$ , dengan amplitude gelombang,  $\zeta_o$ , yang dikenal sebagai *Response Amplitude Operator* (RAO). Frekuensi yang dipakai sebagai absis dapat berupa frekuensi gelombang insiden,  $\omega$ , frekuensi gelombang papasan,  $\omega_e$  atau frekuensi non-dimensi, disesuaikan dengan keperluan analisisnya. Pemakaian frekuensi non-dimensi akan memberikan fleksibilitas bila data respons gerakan akan diskala untuk menganalisis perilaku bangunan laut yang lebih besar, ataupun lebih kecil, namun mempunyai konfigurasi yang tetap; yang umumnya dijumpai pada pemodelan fisik di laboratorium hidrodinamika. Frekuensi non-dimensi, baik yang terkait dengan gelombang insiden maupun gelombang papasan, adalah parameter yang diperoleh dari frekuensi gelombang dengan memperhitungkan ukuran panjang bangunan,  $L$ , dan percepatan gravitasi,  $g$ .

*Response Amplitude Operator* (RAO) atau disebut juga dengan *Transfer Function* merupakan fungsi respon gerakan dinamis struktur yang disebabkan akibat gelombang dengan rentang frekuensi tertentu. RAO merupakan alat untuk mentransfer gaya gelombang menjadi respon gerakan dinamis struktur. Menurut Chakrabarti (1987), persamaan RAO dapat dicari dengan rumus sebagai berikut :

$$RAO(\omega) = \frac{\zeta_{ko}(\omega)}{\zeta_o(\omega)} \quad (2.2)$$

Dimana :

$\zeta_{ko}(\omega)$  = amplitudo struktur

$\zeta_o(\omega)$  = amplitudo gelombang orde-1

### 2.2.3 Teori Gelombang

Besarnya kecepatan gelombang efektif dihitung dengan persamaan kecepatan gelombang sesuai teori gelombang yang berlaku. Penentuan teori gelombang menggunakan diagram *Region of Validity* dengan parameter sebagai berikut (Mouselli, 1981) :

$$\left(\frac{H}{gT^2}\right) \text{ dan } \left(\frac{d}{gT^2}\right) \quad (2.3)$$

Dengan :

H : Tinggi gelombang (m)

g : Gravitasi ( $m/s^2$ )

d : kedalaman perairan (m)

T : Periode gelombang (s)

Nilai yang didapat dari perhitungan persamaan berguna untuk menentukan teori gelombang dengan memakai grafik *Regions of Validity of Wave Theories*. Grafik *Regions of Validity of Wave Theories* dapat dilihat pada Gambar 2.4 di bawah ini :

Gambar 2.4 Grafik *Region of Validity of Wave Theories* (Mouselli, 1981)

Dari grafik tersebut, didapatkan teori gelombang yang berlaku untuk analisa. Setiap teori gelombang memiliki turunan persamaan tersendiri dalam menghitung nilai kecepatan gelombang efektif.

Kebanyakan perhitungan teori gelombang pada perairan tertutup menggunakan teori gelombang *stoke*. Teori gelombang *stoke* merupakan solusi untuk perairan yang membutuhkan tingkat akurasi lebih tinggi dari teori gelombang linier. *Stoke* memasukkan ekspresi deret kecepatan potensial dalam persamaan *Laplace* dan

syarat batas dasar laut (Febrian, 2012). Persamaan kecepatan horizontal partikel air yang digunakan pada teori *stoke* orde dua dapat diketahui dari persamaan berikut :

$$U = \frac{\pi H \cosh ks}{T \sinh kd} \cdot \cos\theta + \frac{3}{4} \left( \frac{\pi H}{L} \right) \frac{\pi H \cosh 2ks}{T \sinh^4 kd} \cdot \cos 2\theta \quad (2.4)$$

Dengan :

$U$  = kecepatan horizontal partikel air, (m/s)

$k$  = angka gelombang =  $2\pi/L$

$L$  = panjang gelombang, (m)

$s$  = jarak vertikal titik yang ditinjau dari dasar laut, (m)

$\theta$  = sudut fase =  $kx - \omega t$

$x$  = jarak horizontal titik yang ditinjau, (m)

$\omega$  = frekuensi gelombang, (rad/s) =  $2\pi/T$

$t$  = waktu yang ditempuh untuk mencapai jarak horizontal titik yang ditinjau, (s)

Persamaan kecepatan horizontal partikel air jika diturunkan akan menjadi percepatan horizontal partikel air dimana persamaannya dapat dilihat pada rumus berikut ini :

$$\frac{\partial u}{\partial t} = \frac{2\pi^2 H \cosh ks}{T \sinh kd} \cdot \sin\theta + \frac{3\pi^2 H}{T^2} \left( \frac{\pi H}{L} \right) \frac{\cosh 2ks}{\sinh^4 kd} \cdot \sin 2\theta \quad (2.5)$$

Kecepatan partikel efektif dari partikel air pada kedalaman tertentu dapat dihitung menggunakan persamaan *Mouselli* (1981) seperti berikut :

$$U_{eff}^2 = 0,778 \cdot U_o^2 \cdot \left( \frac{D}{y_o} \right)^{0.286} \quad (2.6)$$

Dengan:

$U_{\text{eff}}$  = kecepatan efektif partikel air pada ketinggian  $y_0$ , (m/s)

$U_0$  = kecepatan horizontal partikel air yang diketahui pada  $y_0$ , (m/s)

$y_0$  = ketinggian orbit partikel dari dasar laut, (m)

Setelah mendapatkan nilai dari kecepatan partikel gelombang efektif dan kecepatan partikel arus efektif, maka untuk menghitung kecepatan efektif total ( $U_e$ ) adalah dengan me-resultan kedua kecepatan tersebut dengan menggunakan persamaan sebagai berikut :

$$U_e = U_w + U_c \quad (2.6)$$

#### 2.2.4 Beban Gelombang

Syarat pemilihan teori untuk perhitungan gaya gelombang didasarkan pada perbandingan antara diameter struktur ( $D$ ) dengan panjang gelombang ( $\lambda$ ) sebagai berikut :

$D/\lambda > 1$  = gelombang mendekati pemantulan murni, persamaan morison tidak valid

$D/\lambda > 0,2$  = difraksi gelombang perlu diperhitungkan, persamaan morison tidak valid

$D/\lambda < 0,2$  = persamaan morison valid

Berikut adalah teori yang digunakan pada perhitungan gaya gelombang (Indiyono, 2003), yaitu :

##### a. Teori Morison

Persamaan morison mengasumsikan bahwa gelombang terdiri dari komponen gaya inersia dan *drag force* (hambatan) yang dijumlahkan secara linier. Persamaan morison lebih tepat diterapkan pada kasus struktur dimana gaya hambatan merupakan komponen yang dominan. Hal ini biasanya dijumpai pada struktur yang ukurannya ( $D$ ) relatif kecil dibandingkan dengan panjang gelombangnya ( $\lambda$ ).

#### b. Teori Froude-Krylov

Froude-Krylov digunakan bilamana gaya hambatan relatif kecil dan gaya inersia dianggap lebih berpengaruh, dimana struktur dianggap kecil. Teori ini mengadopsi metode tekanan gelombang *incident* dan bidang tekanan pada permukaan struktur. Keuntungan dari teori ini adalah untuk struktur yang simetris, perhitungan gaya dapat dilakukan dengan persamaan terangkai (*closed-form*) dan koefisien-koefisien gayanya mudah ditentukan.

#### c. Teori Difraksi

Bilamana suatu struktur mempunyai ukuran yang relatif besar, yakni memiliki ukuran yang kurang lebih sama dengan panjang gelombang, maka keberadaan struktur akan mempengaruhi timbulnya perubahan arah pada medan gelombang di sekitarnya. Dalam hal ini difraksi gelombang dari permukaan struktur harus diperhitungkan dalam evaluasi gaya gelombang.

### 2.2.5 Spektrum Gelombang

Teori gelombang reguler dapat diaplikasikan pada saat desain metode *single wave* di gunakan. Ini tergantung dari metode yang digunakan pada saat proses pendesainan. Pada gelombang acak, ini di deskripsikan dengan densitas spektrum energi. Spektrum energi gelombang mendeskripsikan energi yang terkandung dari gelombang dan itu didistribusikan keseluruhan jangkauan frekuensi pada gelombang acak. Oleh karena itu. Metode gelombang acak mungkin berguna khususnya pada tahap perencanaan bangunan terapung. (Chakrabakti. 1972) Pemilihan spektrum energi gelombang didasarkan pada kondisi *real* laut yang ditinjau.

Spektrum gelombang yang dipakai dalam tugas akhir ini adalah spektrum JONSWAP. Persamaan spektrum JONSWAP merupakan modifikasi dari persamaan spektrum Pierson-Morkowitz yang disesuaikan dengan kondisi laut yang ada (Djatkiko,2012). JONSWAP merupakan proyek yang dilakukan pada perairan North Sea. Spektrum JONSWAP mendeskripsikan angin yang membangkitkan gelombang dengan kondisi *sea state* yang ekstrim.

Kriteria yang ada di DNV RP-C205, bahwa spektrum JONSWAP dapat diaplikasikan untuk perairan dengan :

$$3.6 < T_p / (H_s)^{1/2} < 5 \quad (2.7)$$

Hal ini didukung dengan pernyataan yang ada pada buku Chakrabarti (1987) bahwa pada kondisi survival di perairan Teluk Meksiko, yang tepat adalah penggunaan spektrum JONSWAP.

Formulasi spektra JONSWAP banyak dipakai dalam perancangan dan analisis bangunan lepas pantai yang dioperasikan di Indonesia. Hal yang mendasari pemakaian spektra JONSWAP dikarenakan karena perairan Indonesia di mana kebanyakan bangunan lepas pantai untuk kegiatan migas dioperasikan adalah perairan kepulauan atau tertutup. Namun dari sejumlah kajian, untuk perairan Indonesia disarankan memakai parameter  $\gamma$  berkisar dari 2.0 hingga 2.5. Hal ini pada intinya adalah untuk mengurangi dominasi energi yang dikontribusikan oleh frekuensi gelombang tertentu saja (Djarmiko, 2012).

Persamaan spektrum JONSWAP dapat ditulis sebagai berikut :

$$S_j(\omega) = A_\gamma S_{PM}(\omega) \gamma^{\exp\left(-0.5 \left(\exp\left(\frac{\omega - \omega_p}{\sigma \omega_p}\right)^2\right)\right)} \quad (2.8)$$

Dengan :

$S_{PM}$  = Spektrum *Pierson-Moskowitz*

$$= \frac{5}{16} H_s^2 \omega_p^{-4} \omega^{-5} \cdot \exp\left(\frac{-5}{4} \left(\frac{\omega}{\omega_p}\right)^{-4}\right) \quad (2.9)$$

$H_s$  = tinggi gelombang signifikan

$\omega_p$  =  $2\pi/T_p$  (*Angular Spectral Peak Frequency*)

$\gamma$  = non-dimensional parameter bentuk puncak

= 2.0-2.5 untuk perairan Indonesia

$\sigma$  = *Spectra Width Parameter*

$$\sigma = 0.07 \text{ untuk } \omega \leq \omega_p$$

$$\sigma = 0.09 \text{ untuk } \omega > \omega_p$$

$A_y = 1 - 0.287 \ln(\gamma)$  adalah *Normalizing Factor*

### 2.2.6 Spektrum Respon Struktur

Spektrum respons didefinisikan sebagai respons kerapatan energi pada struktur akibat gelombang. Spektrum respons merupakan perkalian antara spektrum gelombang dengan RAO kuadrat, secara matematis dapat ditulis seperti pada persamaan 2.10 :

$$S_R = [RAO(\omega)]^2 S(\omega) \quad (2.10)$$

Dimana :

$S_R$  = Spektrum Respons ( $m^2$ -sec)

$S(\omega)$  = Spektrum Gelombang ( $m^2$ -sec)

$RAO(\omega)$  = Transfer Function

$\omega$  = Frekuensi gelombang (rad/sec)

### 2.2.7 Bollard

*Bollard* merupakan salah satu perlengkapan pada dermaga atau pelabuhan yang memiliki fungsi sebagai penambatan tali kapal saat kapal berlabuh. *Bollard* terbuat dari besi cor/baja dan ditanamkan pada fondasi atau bibir dermaga sehingga mampu untuk menahan gaya yang bekerja pada penambatan kapal di dermaga. Adapun jenis-jenis *Bollard* yang beredar di pasaran yaitu :

1. *Tee Bollard* : *Bollard* yang berbentuk seperti kepala ular dan dengan kaki berbentuk setengah lingkaran. Seperti pada Gambar 2.5

Gambar 2.5 *Tee Bollard*

2. *Bitt Bollard* : *Bollard* dengan bentuk bagian atas berupa lingkaran. Seperti pada Gambar 2.6

Gambar 2.6 *Bitt Bollard*

3. *Cross Bollard* : *Bollard* dengan bentuk seperti salib. Seperti pada Gambar 2.7

Gambar 2.7 *Cross Bollard*

4. *Staghorn Bollard* : *Bollard* dengan bentuk bagian atas bulat ditengah dan disampingnya terdapat tanduk-tanduk untuk menambatkan tali. Seperti pada Gambar 2.8.

Gambar 2.8 *Staghorn Bollard*

### 2.2.8 Korosi

Korosi diartikan sebagai kerusakan atau keausan dari material akibat terjadinya reaksi dengan lingkungannya yang didukung oleh faktor – faktor tertentu. Beberapa ahli korosi berpendapat bahwa perkaratan tidak hanya terjadi pada logam saja, namun non-logam juga mengalami korosi yang di golongkan dalam korosi non-logam. Suatu contoh, lunturnya warna cat akibat sengatan matahari, mengendornya karet akibat pengaruh panas dan cuaca, lapuknya kayu konstruksi akibat jamur dll.

Secara garis besar faktor – faktor yang mempengaruhi cepat atau lambatnya korosi adalah :

- Material konstruksi

Material yang dipakai untuk membuat benda konstruksi sangat berpengaruh terhadap laju korosi, dengan demikian harus dipilih sebaik mungkin untuk mengurangi dampak korosi

- Kondisi lingkungan / media

Kondisi lingkungan dimana konstruksi akan dibuat dan digunakan juga merupakan salah satu faktor dalam proses dan kecepatan korosi. Material di

lingkungan air laut akan sangat berbeda dengan lingkungan air tawar. Korosi yang timbul akan dipengaruhi oleh media korosif yang terkandung pada lingkungan

- Bentuk konstruksi

Bentuk korosi yang oleh sebagian orang diabaikan efeknya terhadap proses korosi sebenarnya tidak sedikit dampaknya. Karena bentuk ini sedikit banyak juga akan berpengaruh terhadap kecepatan korosi. Sebagai contoh pipa yang dibengkokkan dengan radius 180° akan sangat berlainan korosinya dengan pipa yang lurus.

- Fungsi konstruksi

Konstruksi baja yang digunakan untuk operasi panas akan berlainan jika dibandingkan dengan suhu operasi rendah. Dengan demikian dapat diambil kesimpulan jika konstruksi tersebut akan dibuat harus dipertimbangkan untuk apa alat tersebut dibuat atau operasi yang bagaimana konstruksi tersebut dipakai

Keempat faktor ini satu sama lain saling berpengaruh dan harus dipertimbangkan secara simultan agar didapatkan bentuk konstruksi yang secara teknis maupun ekonomis dapat menguntungkan.

Berdasar pada teori kimia, korosi terjadi akibat adanya reaksi oksidasi dan reduksi antara material dengan lingkungannya. Reaksi oksidasi diartikan sebagai reaksi yang menghasilkan electron atau reaksi pelepasan electron dan reduksi adalah reaksi antara dua unsur yang menggunakan atau mengikat electron, sebagai contoh ;

Pada proses korosi, salah satu hasil reaksi tersebut diatas akan bereaksi dengan logam lain. Kemudian hasil reaksinya tersebut akan bereaksi lagi dengan logam dan mengakibatkan pengikisan unsur logam tersebut. Proses ini biasa disebut korosi dan diawali terlebih dulu dengan berubahnya logam menjadi ion logam.

Menurut hasil inspeksi, korosi yang terjadi pada *Bollard* yang ada di Terminal Petikemas (PT. TPS) Surabaya adalah korosi jenis *General* (Seragam). Korosi seragam adalah korosi yang terjadi pada permukaan material akibat bereaksi dengan oksigen. Biasanya korosi seragam ini terjadi pada material yang memiliki ukuran butir yang halus dan *homogenitas* yang tinggi.

Korosi seragam adalah jenis korosi dimana pada korosi tipe ini laju korosi yang terjadi pada seluruh permukaan logam atau paduan yang terpapar atau terbuka ke lingkungan berlangsung dengan laju yang hampir sama. Hampir seluruh permukaan logam menampilkan terjadinya proses korosi.

Korosi ini terjadi pada seluruh permukaan logam yang kontak dengan air dengan intensitas yang sama. Akibat korosi ini biasanya logam akan mengalami kehilangan berat paling besar dibandingkan dengan korosi lain. Korosi ini biasa terjadi pada baja karbon yang berada dalam lingkungan atmosfer maupun korosif, sedangkan pada tembaga terjadi laju korosi yang rendah karena adanya lapisan film pelindung pada permukaannya sehingga tembaga memiliki ketahanan korosi yang tinggi.

Jenis korosi ini adalah yang paling umum dimana korosi terjadi secara menyeluruh pada permukaan logam yang terekspos pada lingkungan korosif. Korosi ini sering pula disebut sebagai penipisan (*thinning*) atau *general corrosion*. Contoh paling umum adalah korosi pada logam yang terekspos di udara. Contoh lain adalah serangan oleh asam seperti HCl, H<sub>2</sub>SO<sub>4</sub>, HF, senyawa sulfur, dan sebagainya.

Mekanisme *General Corrosion* : dengan distribusi seragam dari reaktan katodik atas seluruh permukaan logam yang terekspos. Pada lingkungan asam ( $\text{pH} < 7$ ), terjadi reduksi ion hydrogen dan pada lingkungan basa ( $\text{pH} > 7$ ) atau netral terjadi reduksi oksigen. Kedua berlangsung secara “seragam” dan tidak ada lokasi preferensial atau lokasi reaksi katodik atau anodik. Katoda dan anoda terletak secara acak dan bergantian sepanjang waktu. Hasil akhirnya adalah hilangnya kurang lebih yang seragam dimensi.

### **2.2.9 Line Tension**

Menurut API RP 2SK *Third Edition* (2005) *Maximum Tension* dapat dicari dengan menggunakan persamaan berikut :

$$T_{max} = T_{mean} + T_{lfmax} + T_{wfsig} \quad (2.11)$$

$$T_{max} = T_{mean} + T_{wfmmax} + T_{lfsig} \quad (2.12)$$

Dimana :

$T_{max}$  = *Maximum Tension*

$T_{mean}$  = *Mean Tension*

$T_{wfmmax}$  = *Maximum wave frequency tension*

$T_{wfsig}$  = *Significant wave frequency tension*

$T_{lfmax}$  = *Maximum low frequency tension*

$T_{lfsig}$  = *Significant low frequency tension*

Persamaan diatas dapat diaplikasikan pada kondisi *Intact* dan *Damage*

*Breaking Strength* merupakan batasan tegangan maksimum dari *Chain Line* yang tidak boleh dilampaui, artinya *Chain Line* tidak boleh memiliki tegangan lebih dari *Breaking Strength*

$$BS = CBS (D - 2\Delta t \times T)/D \quad (2.13)$$

Dengan :

BS : *Breaking Strength*

CBS : *Catalog Breaking Strength*

D : *diameter Mooring Line*

$\Delta t$  : *Corrosion Allowance*

T : *Service Time*

Menurut API RP 2T untuk *Unity Check* tidak boleh melebihi nilai satu. Secara matematis persamaan *Unity Check* dapat dituliskan sebagai berikut :

$$UC = \frac{\sigma_n \times SF}{\sigma_y} < 1 \quad (2.14)$$

Dengan :

UC : *Unity Check*

$\sigma_n$  : Tegangan Nominal

$\sigma_y$  : Tegangan *Yield* material

Sedangkan kondisi batas tegangan ijin didapat dengan membagi *Yield Strength* dengan *Safety Factor* :

$$\frac{1}{SF} = \frac{\sigma_n}{BS} \quad (2.15)$$

Dengan syarat  $\sigma_n < \sigma_{n,}$  dengan :

$\sigma_{ijin}$  : tegangan ijin

SF : *Safety Factor*

*Safety Factor* untuk kondisi analisis *Mooring* dapat dilihat pada Tabel 2.1

Tabel 2.1 *Safety Factor for Mooring Line*

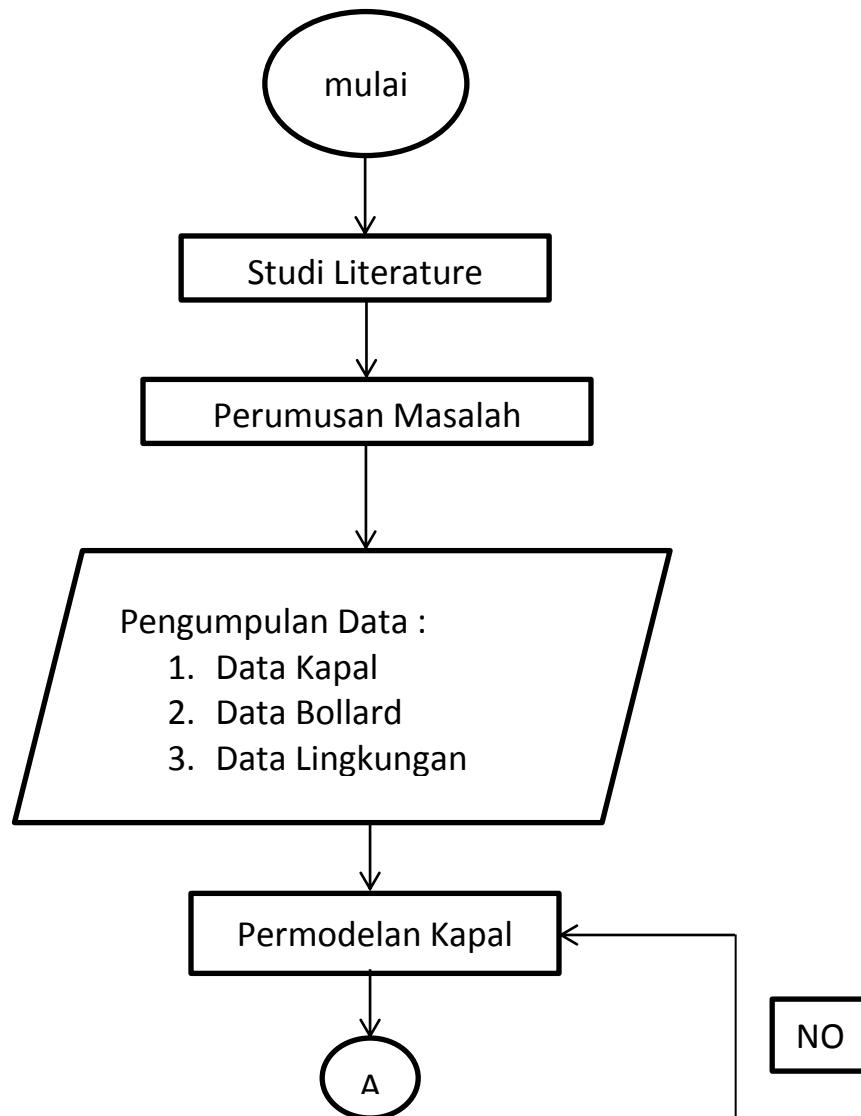

| Condition    | Percent of Breaking Strength (Tension Limit) | Safety Factor |
|--------------|--|---------------|
| Intact (ULS) | 60   | >1.67         |
| Damage (ALS) | 80   | >1.25         |

## BAB III

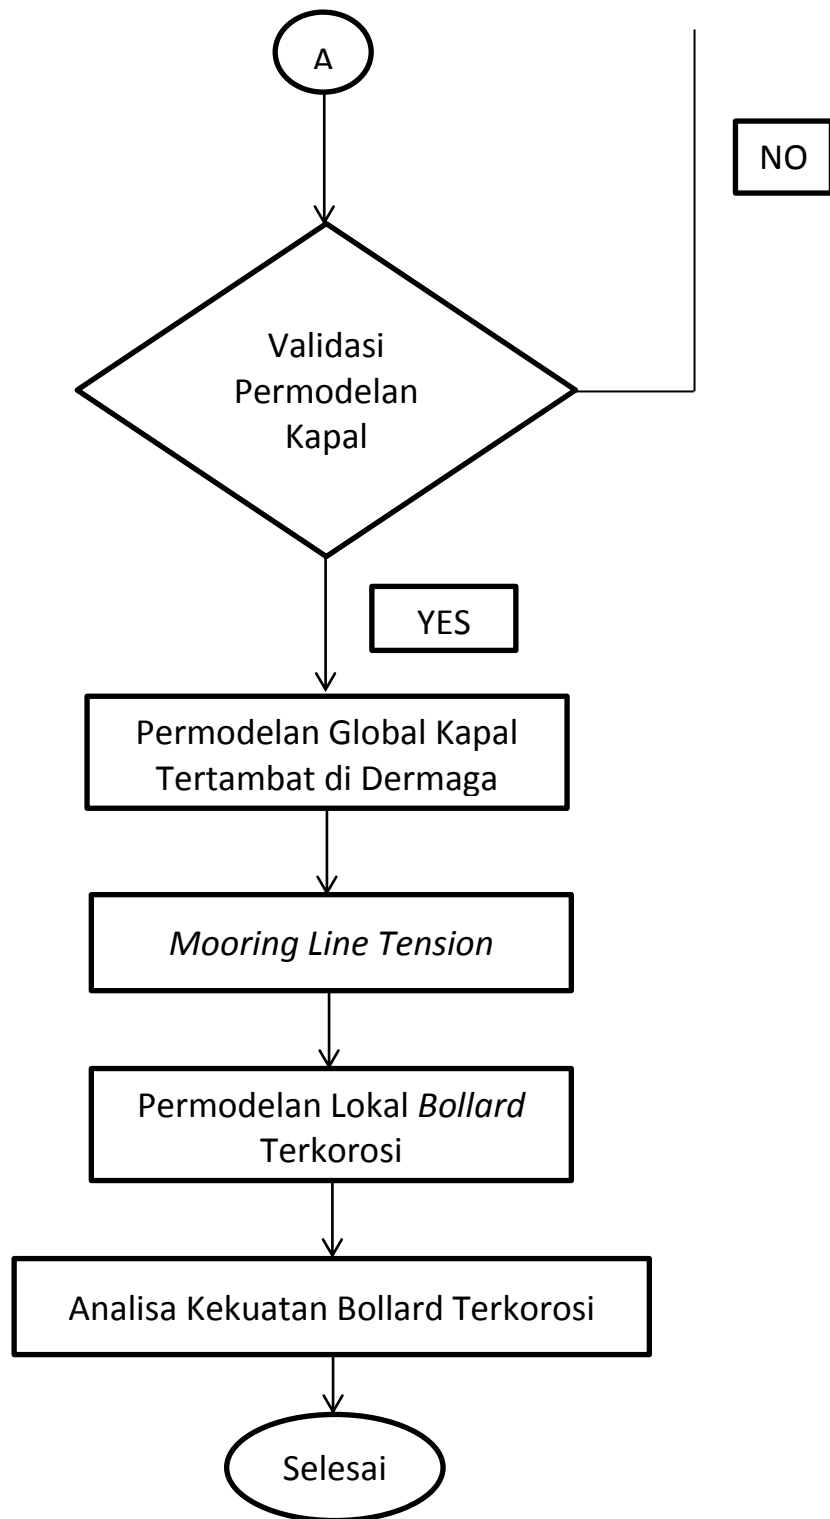

### METODOLOGI PENELITIAN

#### 3.1 DIAGRAM ALIR ( *FLOW CHART* )

Metodologi penelitian yang digunakan dalam Tugas Akhir ini digambarkan dalam *Flow Chart* pada Gambar 3.1 berikut :

Gambar 3.1 Diagram Alir Penelitian Tugas akhir

Gambar 3.1 Diagram Alir Penelitian Tugas akhir (Lanjutan)

### 3.2 PENJELASAN METODOLOGI PENELITIAN

Penjelasan Diagram Alir ( *Flow Chart* ) adalah sebagai berikut :

#### 1. Studi Literatur

Studi literatur merupakan langkah awal yang dilakukan guna membentuk kerangka berpikir terhadap permasalahan yang akan diteliti. Tahap ini dilakukan dengan mempelajari literatur dari buku-buku pendukung, *Codes*, internet, referensi studi sebelumnya dan pencarian data di lapangan.

#### 2. Perumusan Masalah

Menentukan topik masalah yang akan dilakukan dalam studi Tugas Akhir ini.

#### 3. Pengumpulan Data

Data-data yang diperlukan dalam Tugas Akhir ini meliputi :

- Data kapal
- Data *Bollard* terkorosi
- Data lingkungan ( *Metaocean* )

#### 4. Permodelan Kapal

Melakukan permodelan dari data *Sea Practicular* kapal yang memiliki 60.000 DWT dan menggunakan *Software* MAXSURF.

#### 5. Validasi Permodelan

Langkah berikutnya adalah melakukan validasi permodelan dengan menggunakan *Software* MAXSURF. Validasi dilakukan dengan mencari besar nilai hidrostatis pada *Software* MAXSURF dan dibandingkan dengan data awal kapal. Setelah mendapatkan validasi permodelan kapal, kita dapat mencari gerak *Freefloating* kapal tersebut.

#### 6. Permodelan Global Kapal Tertambat di Dermaga

Melakukan permodelan kapal yang tertambat di dermaga. Dalam permodelan ini dibantu dengan menggunakan *Software* ORCAFLEX. selain melakukan permodelan global kapal tertambat, dilakukan pula perhitungan beban yang diakibatkan gelombang, arus dan angin dari 5 arah pembebanan. Analisis ini bertujuan untuk memodelkan keadaan sesungguhnya di lapangan sehingga bisa mendapatkan besaran *Line tension*.

## 7. *Mooring Tension*

Analisis *Mooring Tension* ini dilakukan dengan menggunakan *Software* ORCAFLEX. Analisis ini bertujuan untuk mendapatkan besar tegangan atau *Tension* yang terjadi pada *Mooring Line*. Yang dipakai pada tugas akhir ini adalah *Mooring Line Tension* yang paling besar.

## 8. Permodelan Lokal *Bollard* Terkorosi

Melakukan permodelan *Bollard* yang terkorosi. Permodelan ini dibantu dengan menggunakan *Software* AUTOCAD. *Bollard* yang dimodelkan merupakan *Bollard* yang memiliki tebal baja paling tipis berdasarkan data yang diberikan.

## 9. Analisis Kekuatan

Analisis kekuatan dilakukan dengan menggunakan *Software* ANSYS. Analisis ini bertujuan untuk mendapatkan nilai *Stress*, *Strain* dan deformasi dari *Bollard* tersebut ketika menerima gaya *Line Tension* maksimum dari kapal tertambat. Serta melakukan perhitungan manual untuk mendapatkan *Safety Factor* dari *Actual Force* sehingga dapat dibandingkan dengan *Safety Factor* dari *Bollard* itu sendiri.

## 10. Kesimpulan dan Saran

Memberikan kesimpulan dan saran atau rekomendasi dari hasil Tugas Akhir ini.

## BAB IV

### ANALISA DAN PEMBAHASAN

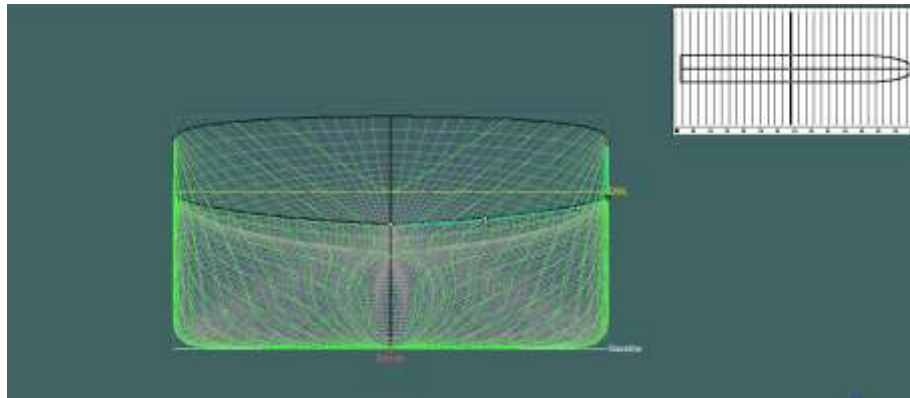

#### 4.1 PERMODELAN KAPAL

Permodelan *Surface Container Ship* Sea-Land Comet dilakukan dengan *Software* Maxsurf. Permodelan Sea-Land Comet dilakukan untuk mendapatkan model dan data hidrostatis. Data yang digunakan sebagai input dalam permodelan *Container Ship* Sea-Land Comet pada maxsurf tertera pada Tabel 4.1 :

Tabel 4.1 *Principal Dimension* Sea-Land Comet

| Principal Dimension               | Nilai | Satuan |
|-----------------------------------|-------|--------|
| <i>Length Perpendicular (LPP)</i> | 262.5 | M      |
| <i>Length Over All (LOA)</i>      | 273   | M      |
| <i>Breadth</i>                    | 32    | M      |
| <i>Draught</i>                    | 11.5  | M      |
| <i>Height</i>                     | 18    | M      |
| <i>Deadweight Toonage</i>         | 59840 | Ton    |

Hasil dari permodelan *Container Ship* Sea-Land Comet dapat dilihat pada Gambar 4.1 sampai Gambar 4.4 :

Gambar 4.1 Hasil Permodelan Sea-Land Comet Tampak Depan

Gambar 4.2 Hasil Permodelan Sea-Land Comet Tampak Samping

Gambar 4.3 Hasil Permodelan Sea-Land Comet Tampak Atas

Gambar 4.4 Hasil Permodelan Sea-Land Comet Tampak Isometri

#### **4.2 VALIDASI PERMODELAN *CONTAINER SHIP* SEA-LAND COMET**

Validasi model *Container Ship Sea-Land Comet* perlu dilakukan agar model menyerupai bentuk sebenarnya. Koreksi yang diijinkan untuk selisih model dengan struktur aslinya adalah 5%. Validasi model dilakukan dengan membandingkan data hidrostatis model dengan data hidrostatis *Container Ship Sea-Land Comet* yang sudah ada. Validasi *Container Ship Sea-Land Comet* dilakukan pada kondisi *Full Load*. Hasil dari validasi tersebut dapat dilihat pada Tabel 4.2 :

Tabel 4.2 Hasil Validasi *Container Ship Sea-Land Comet*

|                                     | Data     | Maxsurf   | Koreksi (%) |
|-------------------------------------|----------|-----------|-------------|
| <i>Displacement (Ton)</i>           | 67637.96 | 68924     | 0.09        |
| <i>Volume (M<sup>3</sup>)</i>       | 67255.7  | 67242.799 | 0.01        |
| <i>Draft to Baseline (M)</i>        | 11.500   | 11.500    | 0.00        |
| <i>Immersed Depth (M)</i>           | 11.500   | 11.500    | 0.00        |
| <i>Coefficient Prismatic (Cp)</i>   | 0.659    | 0.691     | 0.009       |
| <i>Coefficient Block (Cb)</i>       | 0.669    | 0.687     | 0.009       |
| <i>Coefficient Waterplane (Cwp)</i> | 0781     | 0.890     | 0.008       |
| <i>LCB From Zero pt (M)</i>         | 143.88   | 143.925   | 0.009       |
| <i>LCF From Zero pt (M)</i>         | 153.48   | 152.893   | 0.01        |
| <i>KB (M)</i>                       | 6.195    | 6.277     | 0.009       |

Dari validasi yang telah dilakukan pada kondisi *Full Load* terbukti tidak ada koreksi yang melebihi dari 5%. Hal ini menunjukkan bahwa model *Container Ship Sea-Land Comet* dapat diterima untuk analisis perhitungan RAO *Free Floating* dan tertambat.

#### 4.2.1 Analisis Gerakan Kapal pada Keadaan Terapung Bebas (*Freefloating*)

Analisis gerakan kapal dilakukan dalam keadaan terapung bebas (*Free Floating*) dan tertambat. Analisis gerakan kapal terapung bebas dilakukan tanpa ada pengaruh penambatan. Gerakan struktur dapat dilihat dari kurva *Response Amplitude Operator* (RAO). Pada penelitian ini, analisis gerakan struktur kapal

dianalisis dalam kondisi *Full Load*. Kurva RAO menunjukkan amplitude gerakan yang terjadi per meter gelombang regular pada frekuensi tertentu.

Pada dasarnya benda yang mengapung mempunyai 6 mode gerakan bebas yang terbagi menjadi dua kelompok, yaitu 3 mode gerakan translasional dan 3 mode gerakan rotasional ;

1. Mode gerak translasional

- Surge, gerakan transversal arah sumbu x
- Sway, gerakan transversal arah sumbu y
- Heave, gerakan transversal arah sumbu z

2. Mode gerak rotasional

- Roll, gerakan rotasional arah sumbu x
- Pitch, gerakan rotasional arah sumbu y
- Yaw, gerakan rotasional arah sumbu z

Gerakan struktur berbeda pada tiap arah gelombang datang. Pada Tugas Akhir ini arah gelombang yang ditinjau adalah  $0^\circ$ ,  $45^\circ$ ,  $90^\circ$ , dan  $180^\circ$ . Hasil dari amplitudo gerakan kapal pada setiap mode gerak dapat dilihat pada Gambar 4.5 – 4.10 :

1. Gerak translasional

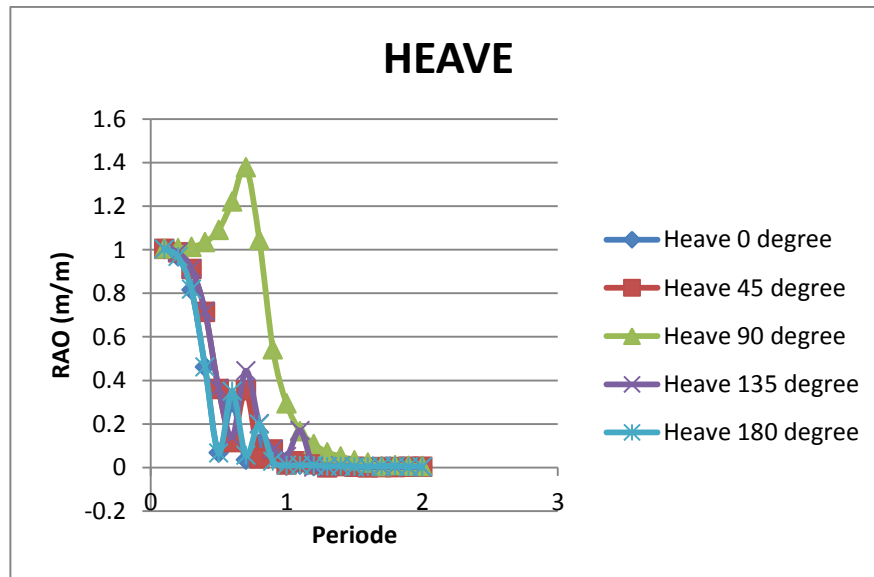

Gambar 4.5 Kurva RAO pada Mode Gerak Surge.

Dari Gambar 4.5 mode gerak Surge maksimal kapal Sea-Land Comet terjadi pada  $0^\circ$ . Dengan nilai sebesar 0.968 m/m pada periode  $0.1\pi$  s.

Gambar 4.6 Kurva RAO pada Mode Gerak Sway

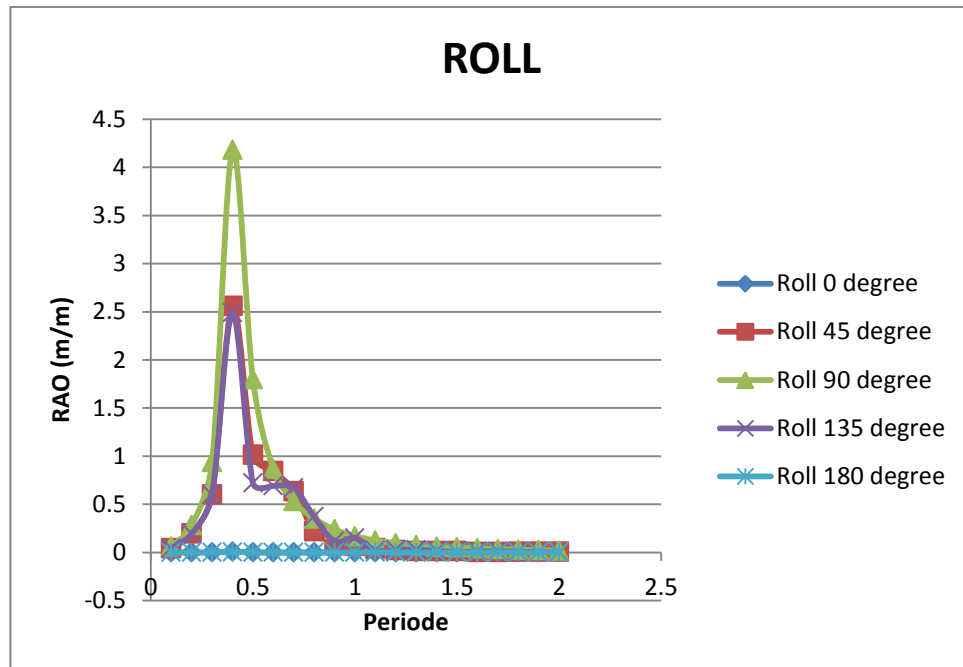

Dari Gambar 4.6 mode gerak Sway maksimal kapal Sea-Land Comet terjadi pada  $90^\circ$ . Dengan nilai sebesar 0.992 m/m pada periode  $0.1\pi$  s.

Gambar 4.7 Kurva RAO pada Mode Gerak Heave

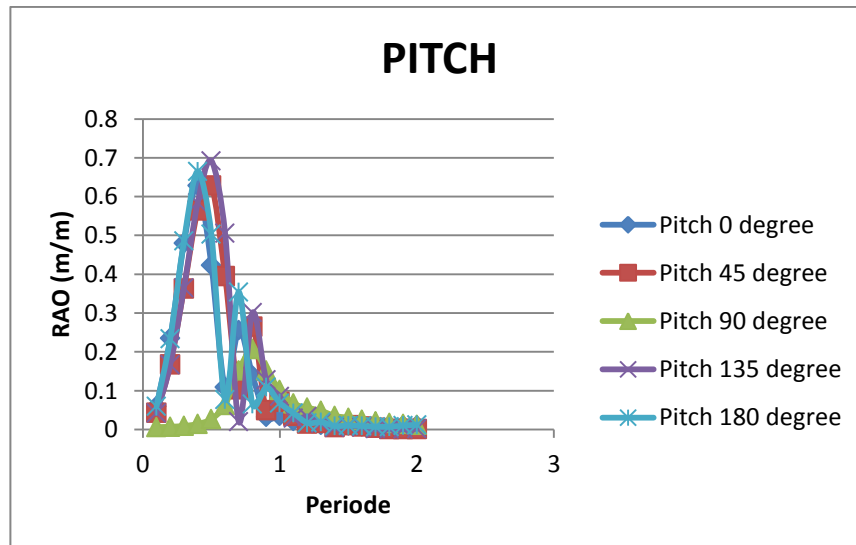

Dari Gambar 4.7 mode gerak Heave maksimal kapal Sea-Land Comet terjadi pada  $90^\circ$ . Dengan nilai sebesar 1.379 m/m pada periode  $0.7\pi$  s.

## 2. Gerak rotasional

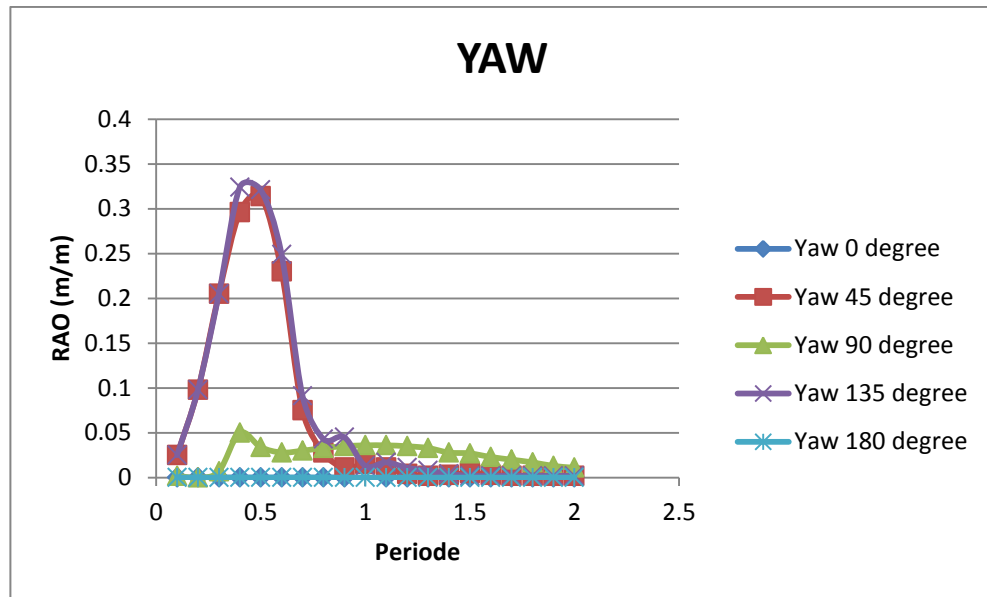

Gambar 4.8 Kurva RAO pada Mode Gerak Roll

Dari Gambar 4.8 mode gerak Roll maksimal kapal Sea-Land Comet terjadi pada  $90^\circ$ . Dengan nilai sebesar  $4.18 \text{ }^\circ/\text{m}$  pada periode  $0.4\pi \text{ s}$ .

Gambar 4.9 Kurva RAO pada Mode Gerak Pitch

Dari Gambar 4.9 mode gerak Pitch maksimal kapal Sea-Land Comet terjadi pada  $135^\circ$ . Dengan nilai sebesar  $0.692 \text{ }^\circ/\text{m}$  pada periode  $0.5\pi \text{ s}$ .

Gambar 4.10 Kurva RAO pada Mode Gerak Yaw

Dari Gambar 4.10 mode gerak Yaw maksimal kapal Sea-Land Comet terjadi pada  $135^\circ$ . Dengan nilai sebesar  $0.324 \text{ }^\circ/\text{m}$  pada periode  $0.4\pi \text{ s}$ .

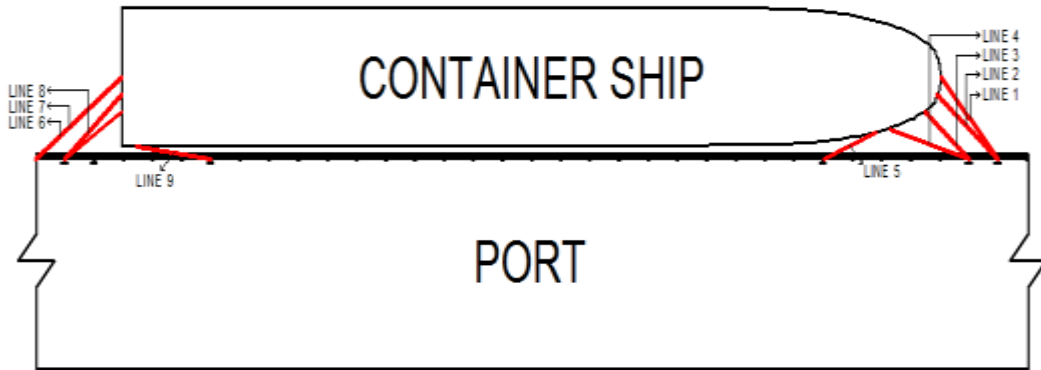

### 4.3 PERMODELAN GLOBAL KAPAL TERTAMBAT

Menurut *Oil Companies International Marine Forum (OCIMF)* dalam bukunya "*Mooring Equipment Guidance*", sistem pertambatan (*Mooring System*) pada pelabuhan ketika kapal berlabuh, sudut yang dibentuk antara titik penambatan kapal dengan titik panambatan pada pelabuhan diwajibkan antara  $20^\circ - 45^\circ$ . Konfigurasi *Mooring Line Pattern* kapal tertambat

Permodelan global kapal tertambat dalam tugas akhir ini dibantu dengan *Software ORCAFLEX*. Pada *Software ORCAFLEX* harus ditentukan terlebih dahulu koordinat X, Y dan Z. Pada permodelan tugas akhir ini koordinat X ditentukan dari ujung kapal, koordinat Y ditentukan dari setengah lebar kapal Sea-Land Comet dan koordinat Z ditentukan dari *Seabed*.

Setelah mengetahui penentuan titik koordinat X, Y, Z, hal yang dilakukan selanjutnya adalah membuat konfigurasi kapal tertambat. Konfigurasi kapal

tertambat dapat dilihat pada Gambar 4.11 – 4.13 dan konfigurasi *Mooring Line Pattern* kapal tertambat dapat dilihat pada Tabel 4.3

Gambar 4.11 Konfigurasi Kapal Tertambat

Tabel 4.3 Konfigurasi *Mooring Line Pattern* Kapal Tertambat

| <i>Mooring Line No</i> | Keterangan          |
|------------------------|---------------------|
| 1                      | <i>Head Lines</i>   |
| 2                      | <i>Head Lines</i>   |
| 3                      | <i>Breast Line</i>  |
| 4                      | <i>Breast Line</i>  |
| 5                      | <i>Spring Lines</i> |
| 6                      | <i>Stern Lines</i>  |
| 7                      | <i>Stern Lines</i>  |
| 8                      | <i>Breast Line</i>  |
| 9                      | <i>Spring Lines</i> |

Gambar 4.12 Hasil Permodelan Konfigurasi Kapal Tertambat di ORCAFLEX

Dalam pemodelan global kapal tertambat di *Software* ORCAFLEX, diperlukan koordinat pada sumbu x,y dan z. Titik acuan penempatan *Bollard* diambil dari titik 0 *Port*, yang disajikan dalam Tabel 4.4 dan Gambar 4.14.

Gambar 4.13 Hasil Permodelan Konfigurasi Kapal Tertambat di ORCAFLEX

Tabel 4.4 Koordinat dan Ukuran Pemodelan *Port*

|             | Koordinat |        |        |
|-------------|-----------|--------|--------|
|             | X         | Y      | Z      |
| <i>Port</i> | -295.00   | -38.00 | 15.00  |
|             | Size      |        |        |
|             | Length    | Width  | Height |
|             | 320       | 20     | 17     |

Kedalaman kolam labuh di dermaga Terminal Petikemas Surabaya (PT. TPS) adalah 15 meter. Dari koordinat dan ukuran pada pemodelan *Port* pada *Software* ORCAFLEX dapat diketahui tinggi dermaga adalah 2 meter diatas permukaan laut. sementara itu titik tengah dari *Port* sejajar dengan koordinat *Midship* kapal Sea-Land Comet. Untuk koordinat *Bollard* dapat dilihat pada Tabel 4.5 :

Gambar 4.14 Titik 0 *Port* pada Permodelan *Software* ORCAFLEX

Tabel 4.5 Koordinat *Bollard* pada *Software* ORCAFLEX

| Bollard<br>No. | Koordinat |         |      |
|----------------|-----------|---------|------|
|                | X         | Y       | Z    |
| 1              | -295.00   | -18.500 | 2.00 |
| 2              | -285.00   | -18.500 | 2.00 |
| 3              | -275.00   | -18.500 | 2.00 |
| 4              | -245.00   | -18.500 | 2.00 |
| 5              | -35.05    | -18.500 | 2.00 |
| 6              | 5.05      | -18.500 | 2.00 |
| 7              | 15.05     | -18.500 | 2.00 |
| 8              | 25.05     | -18.500 | 2.00 |
| 9              | 35.05     | -18.500 | 2.00 |

Untuk koordinat *Mooring Line* pada pemodelan *Software* ORCAFLEX, titik X ditentukan dari ujung kapal, koordinat Y ditentukan dari setengah lebar kapal Sea-Land Comet dan koordinat Z ditentukan dari *Seabed*.

Sementara itu *Mooring Line* yang dipakai pada penelitian ini adalah tipe *Hawser* tipe *Nylon*. Material properties dari *Nylon Hawser* dapat dilihat pada Tabel 4.6. Untuk koordinat *Mooring line* dapat dilihat pada Tabel 4.7:

Tabel 4.6 Spesifikasi Tali Tambat *Nylon Hawser*

| Spesifikasi Tali Tambat ( <i>Hawser</i> ) |       |        |
|---|-------|--------|
|   | Nilai | Satuan |
| Diameter                                  | 68    | Mm     |
| Berat per Satuan Panjang                  | 1.16  | Kg/m   |

Tabel 4.7 Koordinat *Mooring Line*

| <i>Mooring Line</i><br>No. | Koordinat |         |        |
|----------------------------|-----------|---------|--------|
|                            | X         | Y       | Z      |
| 1                          | 0.00      | 0.00    | 18.00  |

| 9                          | -263.39   | -8.94   | 16.63  |
| 10                         | -263      | -8.944  | 16.635 |

#### 4.4 MOORING LINE TENSION

Untuk mencari *Tension* dari setiap *Mooring Line*, maka perlu ditentukan arah-arah pembebanan. Dalam tugas akhir ini arah pembebanan yang dikaji adalah dari arah 0°, 45°, 90°, 135°, dan 180° (Gambar 4.15).

Yang dikategorikan sebagai beban dalam tugas akhir ini adalah beban gelombang, arus dan angin. Beban gelombang, arus dan angin datang dari arah-arah pembebanan yang ditentukan. Data gelombang, arus dan angin dapat dilihat pada Tabel 4.8.

Data tersebut merupakan data operasi normal Terminal Petikemas Surabaya (PT. TPS). Dalam tugas akhir ini kita akan mencari *Mooring Line Tension* ketika dalam keadaan operasi normal dan keadaan badai, dimana keadaan lingkungan akan digandakan untuk mencari *Tension* yang bekerja di *Mooring line* saat kondisi badai.

Tabel 4.8 Data Lingkungan PT. Terminal Petikemas Surabaya (PT. TPS)

| <b>Beban Lingkungan</b>         | <b>Operasi</b>       | <b>Badai</b>                       |                                    |
|---------------------------------|----------------------|------------------------------------|------------------------------------|

Surabaya

Gambar 4.15 Arah Pembebanan Pada Model Kapal

Setelah menentukan arah pembebanan pada model kapal, maka kita dapatkan matriks kondisi pembebanan atau yang dinamakan *Load Case* seperti pada Tabel 4.9 :

Tabel 4.9 Matriks Kondisi Pembebanan

| Kondisi | Arah      |      |       | Keterangan |
|---------|-----------|------|-------|------------|
|         | Gelombang | Arus | Angin |            |
| Operasi | 0°        | 0°   | 0°    | Co-linear  |
|         | 45°       | 45°  | 45°   |            |
|         | 90°       | 90°  | 90°   |            |
|         | 135°      | 135° | 135°  |            |
|         | 180°      | 180° | 180°  |            |
| Badai   | 0°        | 0°   | 0°    | Co-linear  |
|         | 45°       | 45°  | 45°   |            |
|         | 90°       | 90°  | 90°   |            |
|         | 135°      | 135° | 135°  |            |
|         | 180°      | 180° | 180°  |            |

Setelah memasukan matriks kondisi pembebanan tersebut, didapatkan besaran *Mooring Line Tension* yang terjadi pada saat operasi normal dan badai. Besaran *Mooring Line Tension* dapat dilihat pada Tabel 4.10 – 4.11 :

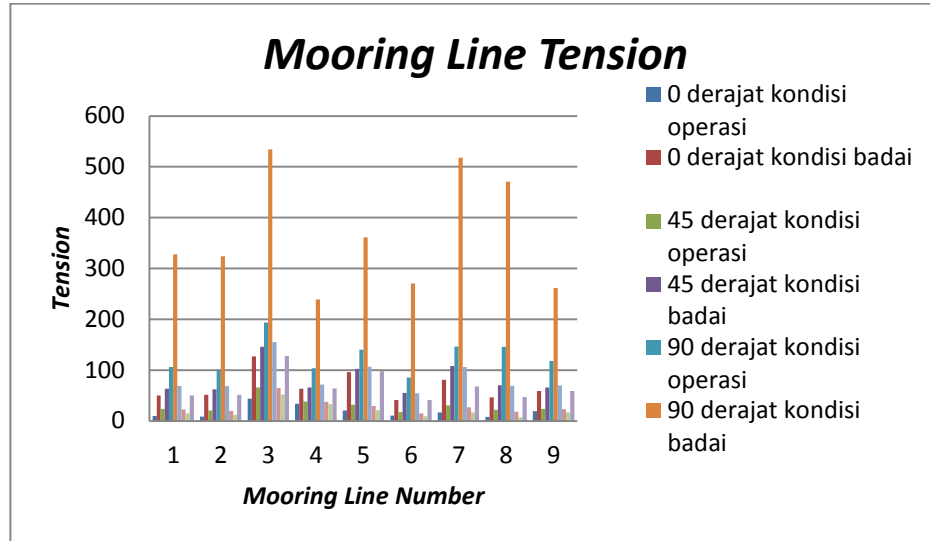

Tabel 4.10 Besar *Mooring Line Tension* pada *Software* ORCAFLEX kondisi operasi

| <i>Mooring Line</i> | <i>Tension on Mooring Line (kN)</i> |        |         |        |        |

Gambar 4.16 Grafik Nilai *Mooring Line Tension*

#### 4.4.1 Analisa *Safety Factor* pada *Mooring Line*

Analisa *Safety Factor* pada *Mooring Line* pada tugas akhir ini didasarkan pada *Code API RP 2SK Third Edition* dimana satuan *Safety factor* pada *Mooring line* adalah *Breaking Strength*. *Breaking Strength* merupakan batasan tegangan maksimum dari *Chain Line* yang tidak boleh dilampaui, artinya *Chain Line* tidak boleh memiliki tegangan lebih dari *Breaking Strength*

$$BS = CBS (D - 2\Delta t \times T)/D$$

Dengan :

BS : *Breaking Strength*

CBS : *Catalog Breaking Strength*

D : diameter *Mooring Line*

$\Delta t$  : *Corrosion Allowance*

T : *Service Time*

Breaking Strength untuk *Mooring line M-Steel Winchline* dengan diameter 68 mm adalah 930 kN. Menurut API RP 2T untuk *Unity Check* tidak boleh melebihi nilai satu. Secara matematis persamaan *Unity Check* dapat dituliskan sebagai berikut :

$$UC = \frac{\sigma_n \times SF}{\sigma_y} < 1$$

Dengan :

UC : *Unity Check*

$\sigma_n$  : Tegangan Nominal

$\sigma_y$  : Tegangan *Yield* material

Sedangkan kondisi batas tegangan ijin didapat dengan membagi *Yield Strength* dengan *Safety Factor* :

$$\frac{1}{SF} = \frac{\sigma_n}{BS}$$

Dengan syarat  $\sigma_n < \sigma_n$ , dengan :

$\sigma_{ijin}$  : tegangan ijin

SF : *Safety Factor*

*Safety Factor* untuk kondisi analisis *Mooring* dapat dilihat pada Tabel 4.12

Tabel 4.12 *Safety Factor* untuk *Mooring Line*

| Condition | Percent of Breaking | Safety Factor |
|-----------|---------------------|---------------|
|-----------|---------------------|---------------|

|              | Strength (Tension Limit) |       |
|--------------|--------------------------|-------|
| Intact (ULS) | 60                       | >1.67 |
| Damage (ALS) | 80                       | >1.25 |

Setelah mengetahui besaran *Tension* yang terjadi, kita dapat mengetahui *Safety Factor* pada kondisi operasi serta dalam kondisi badai. Besar *Safety Factor* dapat dilihat pada Tabel 4.13 - Tabel 4.14.

Tabel 4.13 Besar *Safety Factor* Kondisi Operasi

| Mooring Line | Tension on Mooring Line (kN) |        |         |        |        | MAX     | SF    | STATUS |

#### 4.4.2 Response Amplitude Operator Kapal Tertambat

RAO dari kapal tertambat dapat dilihat pada Gambar 4.17 – Gambar 4.21 pada kondisi operasi dan Gambar 4.22 – Gambar 4.26 pada kondisi badai:

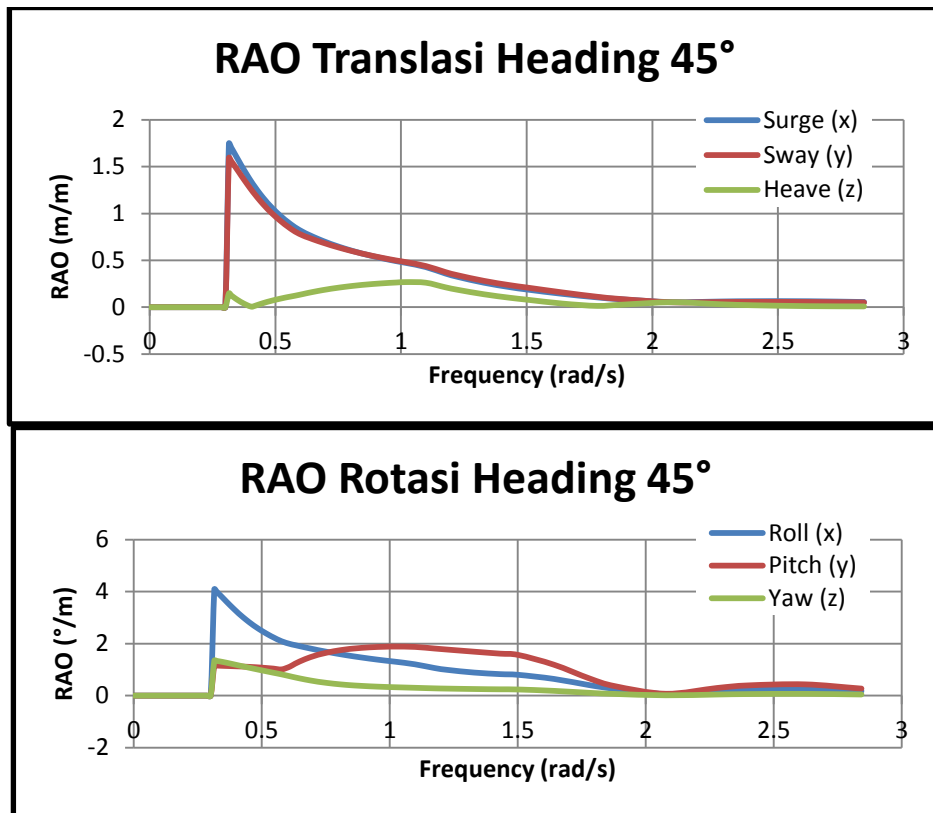

##### 1. Kondisi Operasi

Gambar 4.17 Kurva RAO *Heading* 0°

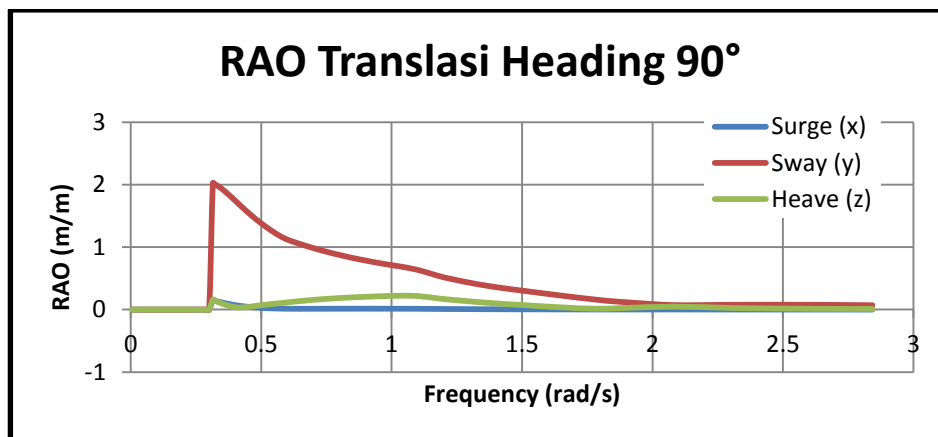

Dari Gambar 4.17 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 0° adalah moda gerak Pitch dengan besar 2.66 °/m pada frekuensi 1.09π dan moda gerak Surge dengan besar 2.45 m/m pada frekuensi 0

Gambar 4.18 Kurva RAO *Heading* 45°

Dari Gambar 4.18 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 45° adalah moda gerak Surge dengan besar 1.78 m/m pada frekuensi  $0.39\pi$  dan moda gerak Roll dengan besar 4.12 °/m pada frekuensi  $0.39\pi$ .

Gambar 4.19 Kurva RAO *Heading* 90°

Dari Gambar 4.19 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 90° adalah moda gerak Sway dengan besar 2.14 m/m dan moda gerak Roll dengan besar 5.47 °/m

Gambar 4.20 Kurva RAO *Heading* 135°

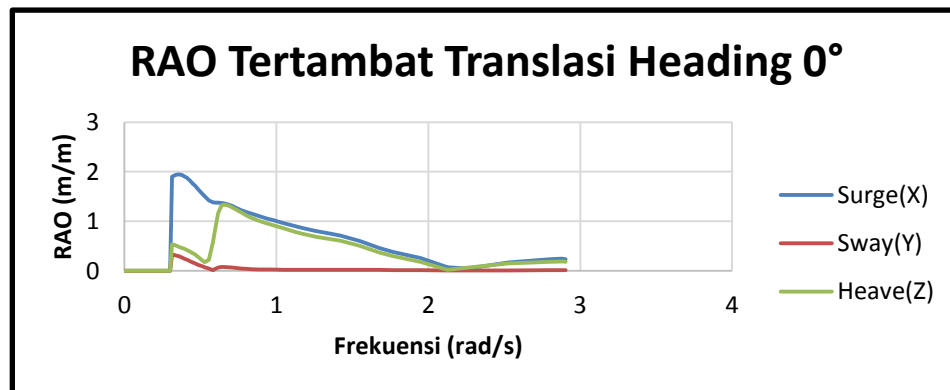

Dari Gambar 4.20 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 135° adalah moda gerak Surge dengan besar 2.09 m/m dan moda gerak Roll dengan besar 7.19 °/m

Gambar 4.21 Gambar RAO *Heading* 180°

Dari Gambar 4.21 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 180° adalah moda gerak Surge dengan besar 2.97 m/m dan moda gerak Yaw dengan besar 2.99 °/m

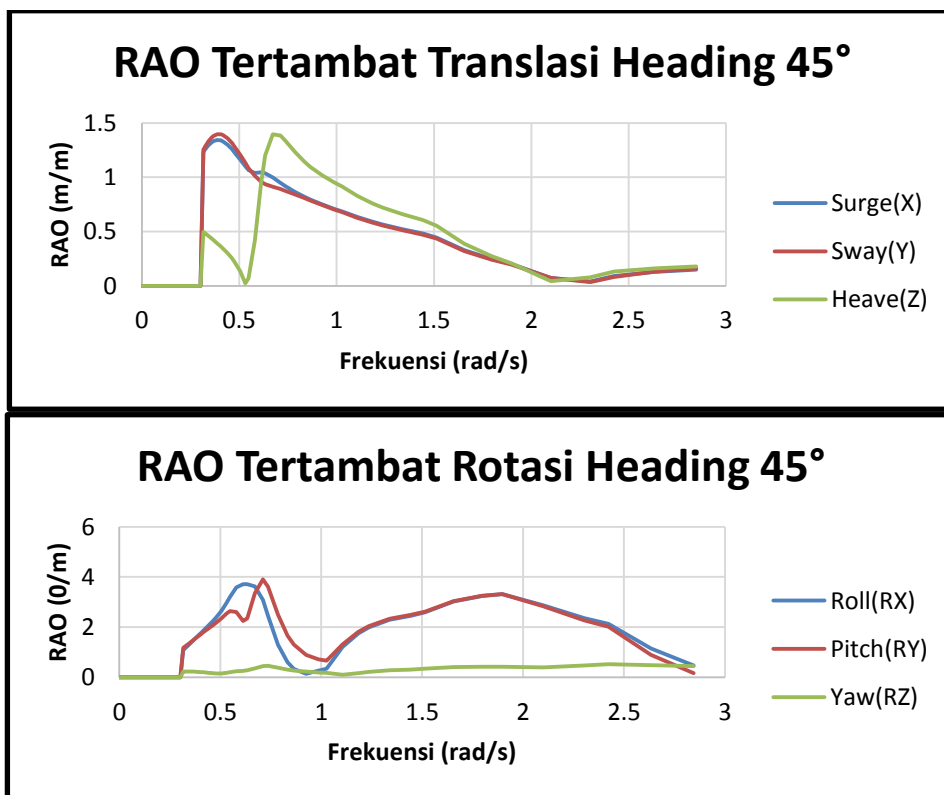

## 2. Kondisi Badai

Gambar 4.22 Kurva RAO *Heading* 0°

Dari Gambar 4.22 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 0° adalah moda gerak Surge dengan besar 1.97 m/m dan moda gerak Yaw dengan besar 5.13 °/m

Gambar 4.23 Kurva RAO *Heading* 45°

Dari Gambar 4.23 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 45° adalah moda gerak Sway dengan besar 1.47 m/m dan moda gerak Pitch dengan besar 3.98 °/m

Gambar 4.24 Kurva RAO *Heading* 90°

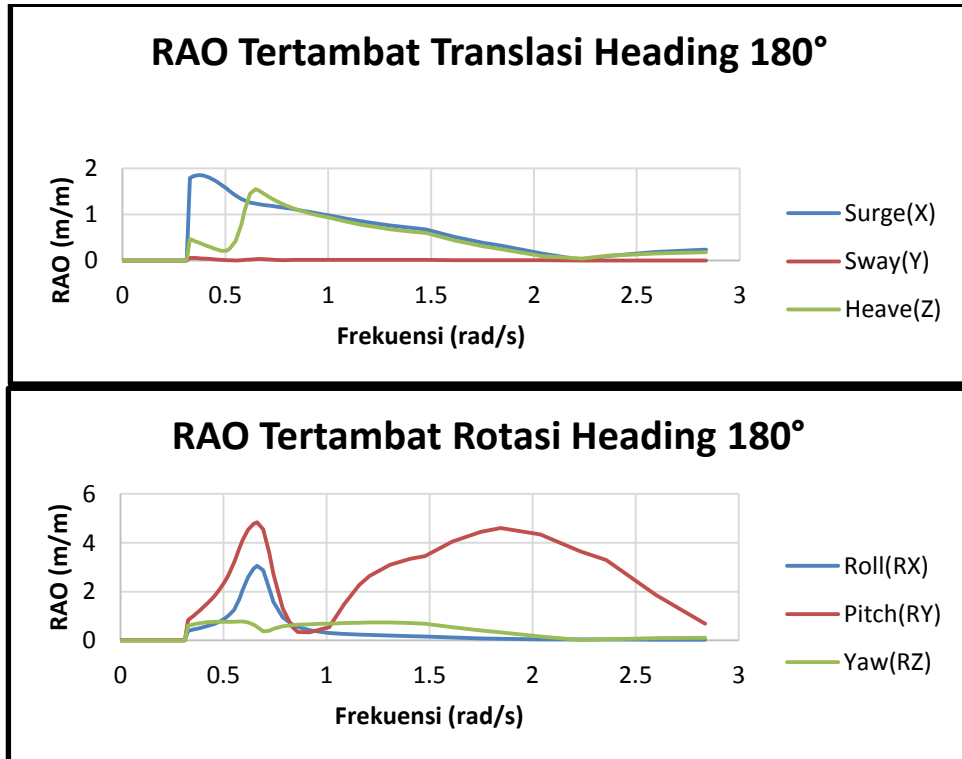

Dari Gambar 4.24 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 90° adalah moda gerak Sway dengan besar 2.24 m/m dan moda gerak Roll dengan besar 11.28 °/m

Gambar 4.25 Kurva RAO *Heading* 135°

Dari Gambar 4.25 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 135° adalah moda gerak Heave dengan besar 1.57 m/m dan moda gerak Roll dengan besar 13.41 °/m

Gambar 4.26 Kurva RAO *Heading* 180°

Dari Gambar 4.26 diketahui moda gerak kapal tertambat paling besar yang dipengaruhi gaya gelombang dari arah *Heading* 180° adalah moda gerak Surge dengan besar 1.77 m/m dan moda gerak Pitch dengan besar 5.46 °/m

#### 4.4.3 Motion Kapal Tertambat

*Motion* kapal tertambat dapat dilihat pada Tabel 4.15 dibawah ini :Tabel

4.15 *Motion* Kapal Tertambat

| Kondisi | Moda Gerak           | Arah |      |      |      |      |
|---------|----------------------|------|------|------|------|------|
|         |                      | 0°   | 45°  | 90°  | 135° | 180° |
| Operasi | Surge (m)            | 0.25 | 0.18 | 0.03 | 0.43 | 0.73 |
|         | Sway (m)             | 0.00 | 0.33 | 1.19 | 0.53 | 0.21 |
|         | Heave (m)            | 0.32 | 0.11 | 0.65 | 0.41 | 0.83 |
|         | Roll ( <i>deg</i> )  | 0.22 | 1.24 | 2.76 | 0.99 | 0.32 |
|         | Pitch ( <i>deg</i> ) | 0.46 | 1.76 | 0.93 | 0.38 | 0.92 |
|         | Yaw ( <i>deg</i> )   | 0.19 | 0,74 | 1.63 | 1.39 | 0.31 |
| Badai   | Surge (m)            | 0.91 | 0.94 | 0.47 | 0.78 | 1.43 |
|         | Sway (m)             | 0.09 | 0.88 | 3.12 | 1.83 | 0.21 |
|         | Heave (m)            | 0.98 | 0.54 | 1.37 | 0.62 | 3.47 |
|         | Roll ( <i>deg</i> )  | 0.43 | 1.99 | 4.75 | 1.46 | 0.63 |
|         | Pitch ( <i>deg</i> ) | 1.34 | 2.53 | 2.18 | 0.93 | 4.33 |
|         | Yaw ( <i>deg</i> )   | 0.31 | 1.44 | 1.75 | 2.65 | 0.53 |

#### 4.5 PERMODELAN LOKAL *BOLLARD* TERKOROSI

Untuk melakukan permodelan lokal *Bollard* terkorosi dalam Tugas Akhir ini, *Software* yang digunakan adalah AUTOCAD 3D. Permodelan *Bollard* terkorosi disesuaikan dengan Laporan 002/MB/ITS-TPS/XII/16/RE Terminal Petikemas (PT. TPS) Surabaya. Dimana dalam laporan (Tabel 4.16) tersebut *Bollard* yang memiliki penipisan ketebalan adalah *Bollard* no.34 di dermaga Internasional Terminal Petikemas Surabaya (PT. TPS). *Bollard* no. 34 memiliki ketebalan rata-rata 25 mm, dimana tebal rata-rata awal *Bollard* baru adalah 30 mm.

Tabel 4.16 Penipisan Penampang *Bollard* no.34 Dermaga Internasional PT. Terminal Petikemas Surabaya (PT. TPS)

| NO. BOLLARD                             | KETEBALAN <i>BOLLARD</i> (mm) |       |       |       |       |   |   |   |   |
|---|-------------------------------|-------|-------|-------|-------|---|---|---|---|
|   | A                             | B     | C     | D     | E     | F | G | H | I |
| DERMAGA INTERNASIONAL KODE 501 S/D 1000 |                               |       |       |       |       |   |   |   |   |
| 33                                      | 34,08                         | 34,19 | 29,31 | 19,36 | 19,96 |   |   |   |   |
| 34                                      | 29,95                         | 10,67 | 24,93 | 29,94 | 29,95 |   |   |   |   |
| 36                                      | 29,98                         | 19,21 | 19,41 | 25,52 | 25,52 |   |   |   |   |

Ketebalan tersebut diukur dari titik acuan yang ditentukan di *Bollard*. Penentuan titik acuan pengukuran ketebalan *Bollard* dapat dilihat pada Gambar 4.27.

#### 4.6 ANALISA KEKUATAN *BOLLARD* TERKOROSI

Untuk menganalisa kekuatan *Bollard* terkorosi, kita harus mengetahui terlebih dahulu kekuatan sisa dari *Bollard* tersebut. Dalam laporan “002/MB/ITS-TPS/XII/16/RE Terminal Petikemas (PT. TPS) Surabaya”, *Yield Stress Bollard* terkorosi dengan ketebalan rata-rata 25 mm adalah 145 Mpa, sedangkan besar *Ultimate Stress* dari *Bollard* terkorosi adalah 147.30 Mpa (Gambar 4.31). Besaran *Stress* didapat dari uji tarik laboratorium di laboratorium PPNS.

Gambar 4.31 Hasil Uji Laboratorium Material *Bollard* Terkorosi

Setelah kita mengetahui besaran *Yield Stress* dan besaran *Ultimate Stress*, kita dapat melakukan analisa kekuatan dengan mencari besaran *Actual Stress*. Besaran

*Actual Stress* dapat dicari dengan bantuan *Software ANSYS*. Besaran *Actual Stress* digunakan untuk mencari nilai *Safety Factor* dari *Bollard Terkorosi*.

Menurut BS 5950:2000 [BS EN 1993] *Marine Structure* dan AS 3990:1993 *Mechanical Equipment Design Safety Factor* untuk *Bollard* adalah 1.3 untuk *Yield Stress* material *Bollard* ketika tidak ada tambatan tali kapal dan 1.5 untuk *Yield Stress* material *Bollard* ketika ada tambatan tali kapal.

#### 4.6.1 Permodelan *Bollard Terkorosi*

Permodelan detail konstruksi *Bollard* dilakukan dengan bantuan *Software AutoCAD 3D*. setelah dilakukan permodelan di *AutoCAD 3D*, model *Bollard* terkorosi tersebut di *Export* ke *Software ANSYS*. Hasil permodelan pada *Software ANSYS* dapat dilihat pada Gambar 4.32 dan *Material Engineering Data* dapat dilihat pada Tabel 4.17 :

Gambar 4.32 Permodelan *Bollard Terkorosi* pada *Software ANSYS*

Tabel 4.17 *Material Engineering Data* Pada ANSYS

| <i>Material</i>         | <i>Density</i><br>(kg/m <sup>3</sup> ) | <i>Yield strength</i><br>(MPa) |
|-------------------------|--|--------------------------------|
| <i>Gray Cast Iron</i>   | 7200                                   | 483                            |
| <i>Concrete</i>         | 2300                                   | 12                             |
| <i>Structural Steel</i> | 7850                                   | 250                            |

#### 4.6.2 Pembebanan Analisis *Bollard* Terkorosi

Untuk mencari besar *Actual Stress* pada *Bollard* Terkorosi menggunakan bantuan ANSYS *Mechanical* dengan menggunakan satu beban, yaitu beban gaya tarik maksimum *Mooring Line Tension*. Dari hasil analisis besar *Mooring Line Tension* diatas didapatkan nilai terbesar yang mengenai *Bollard* Terkorosi adalah 193.906 kN pada saat kondisi operasi dan 534.594 kN pada saat kondisi badai. Nilai *Mooring Line Tension* tersebut terjadi pada *Mooring Line* no. 3. Karena besaran *Mooring Line Tension* tersebut didapatkan dari simulasi gaya yang membentuk sudut, maka perlu diperhitungkan besar *Mooring Line Tension* yang akan dimasukkan kedalam permodelan *Bollard* terkorosi pada *Software* ANSYS. Diketahui pada *Software* ORCAFLEX besaran sudut yang terbentuk antara *Bollard* dengan sudut gaya *Mooring Line Tension* adalah 45°. Pada Besaran gaya tersebut kita asumsikan merupakan besaran gaya vektor yang terjadi diantara sumbu X, Y dan Z. Besaran gaya yang bekerja di sumbu X, Y dan Z dapat dilihat pada matriks kondisi pembebanan pada Tabel 4.18 dan *Boundary Condition Bollard* dapat dilihat pada Gambar 4.33.

Tabel 4.18 Matriks Kondisi Pembebanan Pada ANSYS

| Kondisi | <i>Mooring Line Tension</i> | Arah | Sumbu X                  | Sumbu Y                  | Sumbu Z                  |
|---------|-----------------------------|------|--------------------------|--------------------------|--------------------------|
| Operasi | 193.906 kN                  | 45°  | 1.3711x10 <sup>5</sup> N | 1.3711x10 <sup>5</sup> N | 1.3711x10 <sup>5</sup> N |
| Badai   | 534.594 kN                  |      | 3.7802x10 <sup>5</sup> N | 3.7802x10 <sup>5</sup> N | 3.7802x10 <sup>5</sup> N |

Gambar 4.33 *Boundary Condition Bollard Terkorosi*

#### 4.6.3 *Meshing dan Sensitivity Analysis*

*Meshing* adalah memecah domain atau daerah perhitungan menjadi beberapa daerah – daerah kecil yang disebut dengan *Grid, Mesh* atau *Cell* semakin kecil daerah pada struktur semakin halus pembacaan pembebanan gaya yang terjadi pada struktur tersebut.

*Sensitivity Analysis* dilakukan untuk mengecek apakah model dan tegangan yang dihasilkan dari hasil *Running* sudah benar atau mendekati nilai kebenaran. Pada Tugas Akhir ini, uji *Sensitivity* dilakukan dengan cara variasi ukuran elemen *Meshing* pada setiap kondisi pembebanan yaitu pembebanan operasi normal dan pembebanan badai. Berdasarkan variasi ukuran elemen *Meshing* tersebut didapatkan hasil *Equivalent Stress* atau yang lebih dikenal

dengan *Von Mises Stress*. Hasil dari *Sensitivity Analysis* pada setiap kondisi pembebanan dan besaran nilai *Von Mises Stress* dapat dilihat pada Tabel 4.19 serta pada Gambar 4.34

Tabel 4.19 *Meshing Sensitivity Bollard Terkorosi*

| Ukuran (mm) | Tegangan (MPa) | Element |
|-------------|----------------|---------|
| 40          | 16.21          | 46773   |
| 35          | 15.834         | 53533   |
| 30          | 15.995         | 51900   |
| 25          | 16.011         | 68707   |
| 24          | 15.946         | 73993   |
| 23          | 15.972         | 82137   |
| 22          | 15.978         | 86003   |
| 21          | 16.018         | 115649  |
| 20          | 16.024         | 123104  |
| 19          | 16.025         | 128141  |

Gambar 4.34 Grafik *Meshing Sensitivity*

Berdasarkan Tabel 4.18 dan grafik pada Gambar 4.34, didapatkan ukuran elemen *Meshing* untuk struktur *Bollard* terkorosi efektif dimodelkan pada

ukuran element *Meshing* 20 mm. Ukuran element ini digunakan untuk kondisi operasi normal dan kondisi badai. Hasil dari *Meshing* pada *Software* ANSYS dapat dilihat pada Gambar 4.35 :

Gambar 4.35 *Meshing* Bollard Terkorosi pada *Software* ANSYS

#### 4.6.4 Analisa Tegangan Lokal *Bollard* Terkorosi

Setelah melakukan *Meshing* kita dapat mendapatkan besaran nilai *Von-Mises Stress*, *Strain* dan besaran nilai Deformasi dari *Bollard* terkorosi. Besaran nilai tersebut dapat dilihat pada Tabel 4.20 dan Gambar 4.36 - 4.41 :

Tabel 4.20 Besaran Nilai *Stress*, *Strain*, Deformasi pada ANSYS

| Kondisi | <i>Stress</i><br>(Mpa) | <i>Strain</i><br>(mm/mm) | Deformasi<br>(mm) |
|---------|------------------------|--------------------------|-------------------|
| Operasi | 42.35                  | 0.0004223                | 0.15804           |
| Badai   | 116.76                 | 0.0011643                | 0.43571           |

Gambar 4.36 *Von-Mises Stress* Kondisi Operasi

Gambar 4.37 *Strain* Kondisi Operasi

Gambar 4.38 Deformasi Kondisi Operasi

Gambar 4.39 Von-Mises Stress Kondisi Badai

Gambar 4.40 *Strain* Kondisi Badai

Gambar 4.41 *Deformasi* Kondisi Badai

#### 4.6.5 Perhitungan *Safety Factor*

Menurut BS 5950:2000 [BS EN 1993] *Marine Structure* dan AS 3990:1993 *Mechanical Equipment Design Safety Factor* untuk *Bollard* adalah 1.3 untuk *Yield Stress* material *Bollard* ketika tidak ada tambatan tali kapal dan 1.5 untuk *Yield Stress* material *Bollard* ketika ada tambatan tali kapal. *Safety Factor* (SF) atau faktor keamanan bollard yang dihitung berdasarkan *yield stress* hasil pengujian lab terhadap material *Cast Iron Bollard* sebesar 145 MPa maka didapatkan:

- a. SF Bollard kondisi (*operation*)  
=  $\sigma_y \text{ Cast Iron} / \sigma_{y\max} \text{ operation}$   
= 145 MPa / 42.35 MPa  
= 3.42 (Memenuhi)
- b. SF Bollard kondisi (*storm*)  
=  $\sigma_y \text{ Cast Iron} / \sigma_{y\max} \text{ storm}$   
= 145 MPa / 116.76 MPa  
= 1.24 (Tidak Memenuhi)

## BAB V

### KESIMPULAN DAN SARAN

#### 5.1 KESIMPULAN

Kesimpulan yang didapatkan dari hasil analisa dan pembahasan dalam penelitian Tugas Akhir ini adalah :

1. Nilai *Mooring Line Tension* yang paling besar terjadi pada *Mooring Line* nomor 3 yaitu sebesar 193.906 kN pada saat kondisi operasi dan 534.594 kN pada saat kondisi badai. Dan besar *Safety Factor* dari *Mooring Line* nomor 3 adalah 4.64 pada kondisi operasi dan 1.68 pada kondisi badai.
2. Tegangan (*Stress*) dari *Bollard* terkorosi pada kondisi operasi normal adalah 42.35 MPa, besar strain yang terjadi pada *Bollard* terkorosi kondisi operasi normal adalah 0.0004223 mm/mm dan besar deformasi yang terjadi pada *Bollard* terkorosi kondisi operasi normal adalah 0.15804 mm. Sementara itu tegangan (*Stress*) dari *Bollard* terkorosi pada kondisi badai adalah 116.76 Mpa, besar strain yang terjadi pada *Bollard* terkorosi kondisi badai adalah 0.0011643 mm/mm dan besar deformasi yang terjadi pada *Bollard* terkorosi kondisi badai adalah 0.43571 mm.
3. Besar nilai *Safety Factor* dari *Bollard* terkorosi, berdasarkan besar kekuatan sisa *Yield Stress* material *Bollard* dibagi dengan *Actual Stress* yang terjadi adalah 3.42 pada kondisi operasi dan 1.24 pada kondisi badai. Sehingga *Bollard* terkorosi dengan ketebalan rata-rata 25 mm **Aman** untuk digunakan dalam kondisi operasi sementara untuk kondisi badai *Bollard* terkorosi dengan ketebalan rata-rata 25 mm **Tidak Aman** untuk digunakan

#### 5.2 SARAN

Setelah dilakukan penelitian tentang analisa kekuatan *Bollard* terkorosi pada Tugas Akhir ini, maka untuk melanjutkan penelitian ini dapat dilakukan analisis kelelahan atau *Fatigue* pada *Bollard* terkorosi tersebut.
