**ABSTRAK**

Tiap tahunnya kebutuhan listrik di Indonesia semakin naik, sehingga dibutuhkan tambahan pasokan listrik untuk memenuhi kebutuhan tersebut. Selain dengan menambah jumlah pembangkit listrik, pasokan listrik juga dapat ditingkatkan menggunakan alat yang disebut *Heat Recovery Steam Generator* (HRSG), alat ini bekerja dengan memanfaatkan gas buang dari Pembangkit Listrik Tenaga Gas (PLTG) yang masih memiliki temperatur tinggi untuk memanaskan air di dalam *tubes*, uap hasil pemanasan air di HRSG digunakan untuk memutar *steam turbine*, yang kemudian diubah menjadi energi listrik.

HRSG memiliki sistem perpipaan yang digunakan sebagai sarana transportasi fluida di dalamnya. Sebagai sarana transportasi fluida, sistem perpipaan HRSG memiliki peran yang penting, sehingga harus dipastikan keamanannya. Salah satu parameter keamanan sistem perpipaan adalah tegangan yang bekerja pada pipa. Tegangan pada sistem perpipaan dipengaruhi oleh banyak hal, misalnya *pressure*, *temperature*, fleksibilitas pipa, dan lainnya. Salah satu cara menaikkan fleksibilitas pipa adalah dengan mengubah *layout* pipa, namun hal ini terkadang dibatasi oleh sedikitnya *space* yang tersedia, maka dari itu digunakan *item* yang memiliki fleksibilitas tinggi yang disebut *expansion joint*.

Pada Tugas Akhir ini dilakukan analisa pengaruh penggunaan *expansion joint* terhadap tegangan pipa yang berada di *Heat Recovery Steam Generator* milik PT X, analisa dilakukan dengan variasi kondisi *operating* dan *hydrotest*, ketebalan pipa juga divariasikan berkurang dikarenakan korosi yang terjadi pada pipa selama beroperasi. Dari hasil akhir penelitian didapatkan jika tegangan pipa pada kondisi *hydrotest* lebih tinggi dari tegangan pipa pada *operating condition*, penggunaan *expansion joint* mengurangi *displacement stress* yang terjadi pada pipa, serta tegangan pada pipa semakin tinggi seiring berkurangnya ketebalan pipa, kecuali pada *displacement stress* yang justru menurun.

*Kata kunci : PLTGU, HRSG, Piping System, Expansion Joint, Tegangan, ASME B31.1, AutoPIPE*

## **ABSTRACT**

Each year the electricity demand in Indonesia is increasing, so it needs additional supply of electricity to supply those needs. In addition to increasing the number of power plants, the power supply can also be upgraded using a tool called Heat Recovery Steam Generator (HRSG), this tool works by utilizing exhausted gas from Gas Power Plant (PLTG) which still has high temperature to heat the water in the tubes inside of HRSG, the heated water vapor at HRSG is used to rotate the steam turbine, which is then converted into electrical energy.

HRSG has a piping system used as a means of fluid transport in it. As a means of fluid transport, the HRSG piping system has an important role, so it must be ensured its safety. One of the security parameters of the piping system is the voltage acting on the pipe. The stress on the piping system is influenced by many things, such as pressure, temperature, pipe flexibility, and so on. One way to increase the flexibility of pipes is to change the layout of the pipes, but this is sometimes limited by the minimum available space, hence high flexibility items called expansion joints are used.

In this final project, the analysis of the effect of expansion joint exposure to pipe stresses in PT X's Heat Recovery Steam Generator, the analysis is done by the variation of operating and hydrotest conditions, the thickness of the pipe is also varied due to corrosion of the pipe during operation. From the final results of the study, the pipe stress on the hydrotest condition is higher than the pipe voltage in the operating condition, the use of the expansion joint reduces the stress on the pipe, and the tension on the pipe is higher as the pipe thickness decreases.

## KATA PENGANTAR

*Alhamdu lillahi rabbil 'alamin.* Segala puji dan syukur Penulis panjatkan kepada Allah SWT yang telah memberikan rahmat serta kekuatan hingga akhirnya penulis dapat menyelesaikan Tugas Akhir dengan judul “Analisa Pengaruh Penggunaan *Expansion Joint* Terhadap Tegangan Sistem Perpipaan *Heat Recovery Steam Generator (HRSG)*”.

Tugas Akhir ini disusun guna memenuhi persyaratan dalam menyelesaikan Studi Kesarjanaan (S-1) di Departemen Teknik Kelautan, Fakultas Teknologi Kelautan (FTK), Institut Teknologi Sepuluh Nopember Surabaya (ITS). Tugas Akhir ini membahas tentang pengaruh penggunaan *expansion joint* terhadap tegangan sistem perpipaan di *Heat Recovery Steam Generator (HRSG)*, analisa tegangan dilakukan menggunakan *software AutoPIPE*.

Penulis sadar bahwa dalam pelaksanaan dan penulisan Tugas Akhir ini masih jauh dari kesempurnaan sehingga kritik dan saran yang membangun sangat penulis harapkan agar kedepannya Penulis dapat membuat karya yang lebih baik. Akhir kata Penulis berharap penelitian ini dapat bermanfaat bagi segala pembaca pada umumnya dan Penulis pada khususnya.

Surabaya, Januari 2018

Nur Kholifah

## **UCAPAN TERIMA KASIH**

Dalam menyelesaikan masa perkuliahan penulis tidak terlepas dari bantuan serta dorongan dari berbagai pihak baik secara langsung maupun tidak langsung. Penulis ingin berterima kasih kepada semua pihak yang telah membantu. Pada kesempatan ini penulis ingin mengucapkan terima kasih kepada:

1. Allah SWT atas limpahan rahmat dan nikmatnya sehingga penulis dapat menyelesaikan tugas akhir ini.
2. (Alm) Bapak Koiri dan Ibu Suparti selaku kedua orang tua yang selalu mendoakan dan memberikan dukungan untuk menyelesaikan perkuliahan dengan baik.
3. Bapak Ir. Imam Rochani, M.Sc. selaku dosen pembimbing I dan Bapak Nur Syahroni, S.T., M.T., Ph.D selaku dosen pembimbing II. Terima kasih atas segala bimbingan, ilmu serta dukungan kepada saya selama proses penggerjaan Tugas Akhir ini.
4. Bapak Dr. Eng. Rudi Walujo Prastianto, S.T., M.T. selaku dosen wali saya selama berkuliah di Departemen Teknik Kelautan, Fakultas Teknologi Kelautan, Institut Teknologi Sepuluh Nopember. Terima kasih atas bimbingan dan arahan Bapak.
5. Seluruh dosen dan karyawan Departemen Teknik Kelautan yang telah memberikan ilmu, bantuan, dan fasilitas selama masa perkuliahan saya.
6. Teman-teman Maelstrom P54 L32 yang selalu menjadi ‘rumah’ saya selama menjalani kehidupan di kampus.
7. Muariff Agustian dan Abdul Malik Al Fatah yang menemani masa perkuliahan saya di Teknik Kelautan sejak awal perkuliahan hingga berakhir status mahasiswa saya.

Serta semua pihak yang telah membantu, mohon maaf penulis tidak dapat menyebutkan satu-persatu. Terima kasih atas bantuan, dukungan, dan doa yang telah diberikan, sehingga penulis mampu menyelesaikan Tugas Akhir ini. Semoga Allah SWT memberikan rahmat-Nya kepada kita semua.

# BAB I

## PENDAHULUAN

### 1.1. Latar Belakang

Saat ini listrik menjadi salah satu kebutuhan pokok manusia, tiap tahunnya kebutuhan listrik di Indonesia semakin naik. Berdasarkan dokumen Rencana Strategis (Renstra) Direktorat Jenderal Ketenagalistrikan Kementerian Energi dan Sumber Daya Mineral Indonesia 2015 - 2019, pada awal periode Renstra 2010 - 2014, rasio elektrifikasi di Indonesia hanya sebesar 67,15% dan pada akhir tahun 2014 meningkat menjadi 84,35%. Rasio elektrifikasi di beberapa bagian di Indonesia dapat dilihat pada Gambar 1.1. Seiring kebutuhan listrik yang terus meningkat, maka Indonesia juga membutuhkan tambahan pasokan listrik. Selain dengan membangun pembangkit, pasokan listrik juga dapat ditambah dengan memaksimalkan kapasitas pembangkit listrik yang telah ada. Pada Gambar 1.1. dapat dilihat rasio elektrifikasi di Indonesia pada tahun 2014.

Gambar 0.1 Rasio Elektrifikasi di Indonesia Tahun 2014  
(Sumber: *Direktorat Jenderal Ketenagalistrikan, 2015*)

Di Indonesia sendiri telah banyak dibangun pembangkit listrik dengan berbagai macam sumber energi, salah satunya adalah PLTG (Pembangkit Listrik Tenaga Gas) yang memanfaatkan gas dengan suhu yang tinggi untuk menggerakkan turbin gas yang terhubung dengan generator sehingga dapat

menghasilkan energi listrik. Gas buang sisa penggunaan PLTG masih dapat dimanfaatkan untuk memanaskan air di dalam suatu alat bernama *Heat Recovery Steam Generator* (HRSG) karena masih memiliki suhu yang tinggi (sekitar 500°C). Dari proses pembakaran di dalam HRSG dihasilkan *steam* yang digunakan untuk menggerakkan *steam turbine*, sehingga dapat pembangkit dapat menghasilkan lebih banyak energi listrik. Dengan demikian dengan penggunaan HRSG didapatkan efisiensi thermal yang besar. Pada Gambar 1.2 dapat dilihat struktur dari *Heat Recovery Steam Generator* (HRSG).

Gambar 0.2 *Heat Recovery Steam Generator* (HRSG)  
(Sumber: [listrikindonesia.com](http://listrikindonesia.com), 2013)

Pada HRSG terdapat banyak komponen yang memiliki fungsinya masing-masing, diantaranya adalah *inlet duct*, *deaerator*, *duct burner*, *stack*, sistem perpipaan, *casing*, SCR, dan lain sebagainya. Sebagai sarana transportasi fluida, sistem perpipaan HRSG memiliki peran yang penting, sehingga harus dipastikan keamanannya. Salah satu parameter keamanan sistem perpipaan adalah tegangan yang bekerja pada pipa. Tegangan pada sistem perpipaan dipengaruhi oleh banyak hal, misalnya *pressure*, *temperature*, fleksibilitas pipa, dan lainnya. Salah satu cara menaikkan fleksibilitas pipa adalah dengan mengubah *layout* pipa, namun hal ini terkadang dibatasi oleh sedikitnya *space* yang tersedia, maka dari itu digunakan *item* yang memiliki fleksibilitas tinggi yang disebut *expansion joint*. Pada Tugas Akhir ini dilakukan analisa pengaruh penggunaan *expansion joint* terhadap tegangan pipa yang berada di HRSG milik PT X, analisa dilakukan dengan variasi kondisi dan ketebalan pipa yang berkurang akibat terjadinya korosi.

## **1.2. Rumusan Masalah**

Permasalahan yang akan diselesaikan dalam penelitian ini adalah:

1. Bagaimana pengaruh penggunaan *expansion joint* terhadap tegangan yang terjadi pada sistem perpipaan?
2. Bagaimana pengaruh korosi pada pipa terhadap tegangan yang terjadi pada sistem perpipaan?
3. Pada kondisi apakah sistem perpipaan mengalami tegangan paling besar?

## **1.3. Tujuan Penelitian**

Tujuan yang akan dicapai dalam penelitian ini adalah:

1. Mengetahui pengaruh penggunaan *expansion joint* terhadap tegangan yang terjadi pada sistem perpipaan.
2. Mengetahui pengaruh korosi pada pipa terhadap tegangan yang terjadi pada sistem perpipaan.
3. Mengetahui kondisi sistem perpipaan yang mengalami tegangan paling besar.

## **1.4. Manfaat Penelitian**

Manfaat penelitian dalam Tugas Akhir ini adalah:

### 1. Bagi Mahasiswa

Menjadi sarana menambah ilmu pengetahuan tentang analisis tegangan yang terjadi pada sistem perpipaan.

### 2. Bagi Perguruan Tinggi

Menjadi sumber informasi yang dapat dijadikan referensi bila ada penelitian serupa atau pun bila ada penelitian yang lebih lanjut.

### 3. Bagi Perusahaan

Dapat dijadikan bahan evaluasi untuk desain sistem perpipaan HRSG yang ada di perusahaan.

## **1.5. Batasan Masalah**

Adapun batasan masalah dari Tugas Akhir ini adalah sebagai berikut:

1. Analisa dilakukan dengan bantuan *software AutoPIPE*.
2. Analisa dilakukan pada *blowdown tank line pipe Heat Recovery Steam Generator* (HRSG) milik PT X.

3. *Code* yang digunakan dalam analisa ini adalah ASME B 31.1 *Power Piping*.
4. Analisa dilakukan pada *operating and hydrotest condition*.
5. Variasi ketebalan pipa dilakukan menggunakan data yang memiliki deviasi paling besar akibat terjadinya korosi.

### **1.6. Sistematika Penulisan**

Sistematika penulisan yang digunakan dalam penyusunan Tugas Akhir ini terdiri dari lima bab sebagai berikut:

#### **BAB I PENDAHULUAN**

Pada bab ini penulis menjelaskan latar belakang permasalahan dari penelitian, persamaan masalah dari penelitian, tujuan dari penelitian, manfaat penelitian kedepannya dari penelitian yang akan dilakukan, batasan masalah dari penelitian, dan sistematika penulisan Tugas Akhir ini.

#### **BAB II TINJAUAN PUSTAKA DAN DASAR TEORI**

Pada bab ini penulis menjelaskan penelitian yang pernah dilakukan terdahulu, serta beberapa teori dasar yang mendukung penelitian pada Tugas Akhir ini.

#### **BAB III METODOLOGI PENULISAN**

Pada bab ini penulis menggambarkan sekaligus menjelaskan diagram alir dalam melakukan penelitian Tugas Akhir ini.

#### **BAB IV ANALISA HASIL DAN PEMBAHASAN**

Pada bab ini penulis menampilkan data dari *blowdown tank line pipe* di *Heat Recovery Steam Generator (HRSG)* PT X dan menjelaskan pemodelan *piping system* di *software AutoPIPE* beserta hasil analisa tegangan yang telah dilakukan.

#### **BAB V PENUTUP**

Bab ini berisi jawaban dari permasalahan Tugas Akhir serta berisi kesimpulan penelitian dan saran untuk penelitian akan datang.

## BAB II

### TINJAUAN PUSTAKA DAN DASAR TEORI

#### 2.1. Tinjauan Pustaka

Pada penelitian yang dilakukan Kurniawan (2008) dilakukan analisis integritas kekuatan sistem perpipaan pada *topside platform* di area Lima Laut Jawa menggunakan *software* perpipaan AutoPIPE 2004 berdasarkan kode ASME B31.3 *Piping Process*. Pada penelitian dilakukan analisis tegangan ultimate untuk menentukan sisa umur sistem perpipaan akibat pembebahan yang terus-menerus terjadi, baik akibat tekanan operasi, temperatur operasi dan juga akibat *subsidence* yang terjadi pada area tempat sistem perpipaan berada. Dari hasil analisis tegangan diketahui bahwa sistem perpipaan berada di kondisi kritis akibat fenomena *subsidence*, namun hal itu dapat diatasi dengan tindakan mitigasi berupa penambahan tumpuan pipa di dekat lokasi kritis.

Larastyawati (2014) melakukan analisa tegangan pada sistem perpipaan *Demineralized Water Treatment* pada beberapa mode operasi pompa pada *software* Caesar II 5.10, mode operasional pompa diterapkan dengan memvariasikan temperatur pada tiap segmen pipa. Setelah dianalisis ternyata diperlukan adanya modifikasi desain karena didapatkan gaya dan momen yang melebihi nilai *allowable loading nozzle* API 610. Dengan metode analysis didapatkan desain modifikasi dengan *expansion loop* aman terhadap getaran pompa, karena dapat mereduksi gaya dan momen pada *nozzle* pompa.

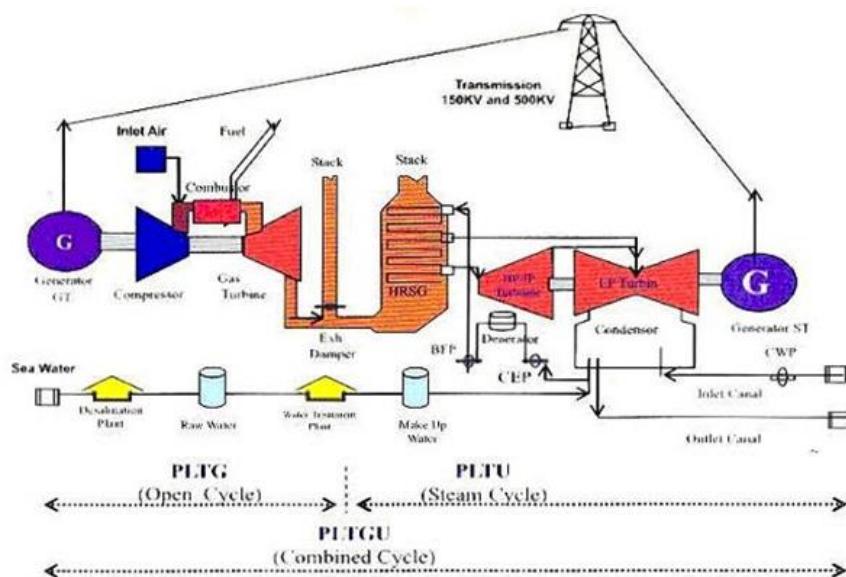

#### 2.2. Landasan Teori

##### 2.2.1. Pembangkit Listrik Tenaga Gas dan Uap (PLTGU)

PLTGU merupakan gabungan dari PLTG dan PLTU. Proses dari PLTG diawali dari *compressor* yang memompa udara ke ruang bakar, yang kemudian dibakar dengan bahan bakar gas alam. Hasil dari pembakaran tersebut adalah gas yang memiliki tekanan dan temperatur tinggi. Kemudian gas tersebut dialirkan untuk memutar turbin yang disalurkan dengan generator, maka saat turbin berputar maka generator juga berputar. Posisi kompresor juga seporos dengan turbin, jadi tekanan gas yang dihasilkan dari ruang bakar selain memutar turbin juga memutar kompresor yang kemudian dikonversikan menjadi energi listrik. Pada gas yang

telah melalui *gas turbine* tadi, dibuang ke atmosfer melalui *stack*. Gas yang dibuang biasanya masih bertemperatur tinggi, sekitar 500°C. Siklus pada PLTG ini biasa disebut *open cycle*.

PLTGU terdiri dari *turbine gas plant*, *Heat Recovery Steam Generator* (HRSG), dan *steam turbine plant*. PLTGU dibangun untuk memanfaatkan gas buang dari PLTG yang masih bertemperatur tinggi dengan bantuan suatu alat yang disebut *Heat Recovery Steam Generator* (HRSG), di dalam HRSG terdapat banyak *tubes* yang dialiri air, gas buang dari PLTG tersebut kemudian digunakan untuk membakar air di dalam HRSG dan mengubahnya menjadi uap yang kemudian digunakan untuk memutar *steam turbine*. Jadi pada PLTGU terdapat dua proses yang menghasilkan energi listrik, proses menggunakan *gas turbine* dan *steam turbine*. Siklus pada PLTGU biasa disebut *combine cycle*. Banyaknya energi listrik yang dihasilkan oleh PLTGU bergantung dari *exhaust gas* dari PLTG itu sendiri. Pada Gambar 2.1 dapat dilihat bahwa *open cycle* terdiri dari *compressor*, *combuster chamber*, *gas turbine*, *generator*. Kemudian setelah melalui *open cycle* gas buang dimasukkan ke HRSG lalu diproses sehingga dapat memutar *steam turbine*.

Gambar 2.3 *Open cycle and Combine Cycle*  
(Sumber: Djafar, 2013)

## 2.2.2. *Heat Recovery Steam Generator (HRSG)*

*Heat Recovery Steam Generator* atau yang sering disingkat HRSG adalah suatu komponen di *power plant* yang memanfaatkan energi panas dari gas buang

PLTG yang masih memiliki *temperature* tinggi untuk memanaskan air yang dialirkan melalui *tubes* sehingga akan menghasilkan uap yang digunakan untuk memutar *steam turbin*. Dengan demikian alat ini akan memberikan efisiensi termal yang besar. HRSG bekerja dengan mengalirkan gas buang bersuhu tinggi dari turbin gas ke dalam HRSG yang berisi *tubes*, sehingga air yang mengalir di dalam *tubes* berubah menjadi uap, air yang bercampur uap tersebut kemudian dialirkan menuju drum untuk dipisahkan antara air dan uap. Uap hasil dari pemanasan tersebut kemudian digunakan untuk memutar *steam turbin*, yang kemudian akan dikonversikan menjadi energi listrik.

Kapasitas produksi uap yang dihasilkan oleh HRSG bergantung pada besar energi panas yang diperoleh dari *exhaust gas* dari turbin gas. Tentunya besar kapasitas produksi uap HRSG juga berpengaruh pada besarnya kapasitas energi listrik yang dapat dihasilkan oleh PLTGU. Namun penggunaan HRSG sangat perpengaruh pada kapasitas pembangkit listrik, penggunaan HRSG dapat menambah kapasitas energi listrik hingga kurang lebih 30% - 50% dari kapasitas awal.

### **2.2.2.1 Jenis HRSG Berdasarkan Sumber Panas**

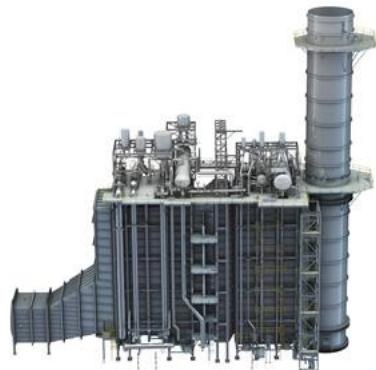

#### ***Fired and Unfired***

Jika ditinjau dari sumber panasnya, terdapat dua jenis HRSG, yaitu HRSG *unfired* dan HRSG *fired* (*supplementary burner*). HRSG *unfired* memperoleh sumber panasnya dari gas buang (*exhaust gas*) turbin gas PLTG, sedangkan HRSG *fired* (*supplementary burner*) merupakan HRSG yang menggunakan *burner* yang bertujuan untuk meningkatkan *temperature* dari *exhaust gas* PLTG.

### **2.2.2.2 Jenis HRSG Berdasarkan Sumber Konstruksinya**

#### ***Horizontal Type***

HRSG tipe horizontal merupakan HRSG dengan aliran gas horizontal, sedangkan aliran airnya *natural circulation* sehingga tidak membutuhkan pompa, namun HRSG tipe ini membutuhkan area atau lahan yang cukup besar, dan ukuran *tubes* dengan OD lebih besar. HRSG ini memiliki *support* yang berada di *top* atau *bottom*.

Gambar 2.4 HRSG *Horizontal Type*  
(Sumber : [gepower.com](http://gepower.com))

#### ***Vertical Type***

HRSG tipe vertikal merupakan HRSG dengan aliran gas vertikal, sedangkan aliran airnya *forced circulation* sehingga membutuhkan pompa, namun HRSG tipe ini membutuhkan area atau lahan yang sedikit, dan ukuran *tubes* dengan OD lebih kecil. HRSG ini memiliki *support* yang berada di *top*.

Gambar 2.5 HRSG *Vertical Type*  
(Sumber : [gepower.com](http://gepower.com))

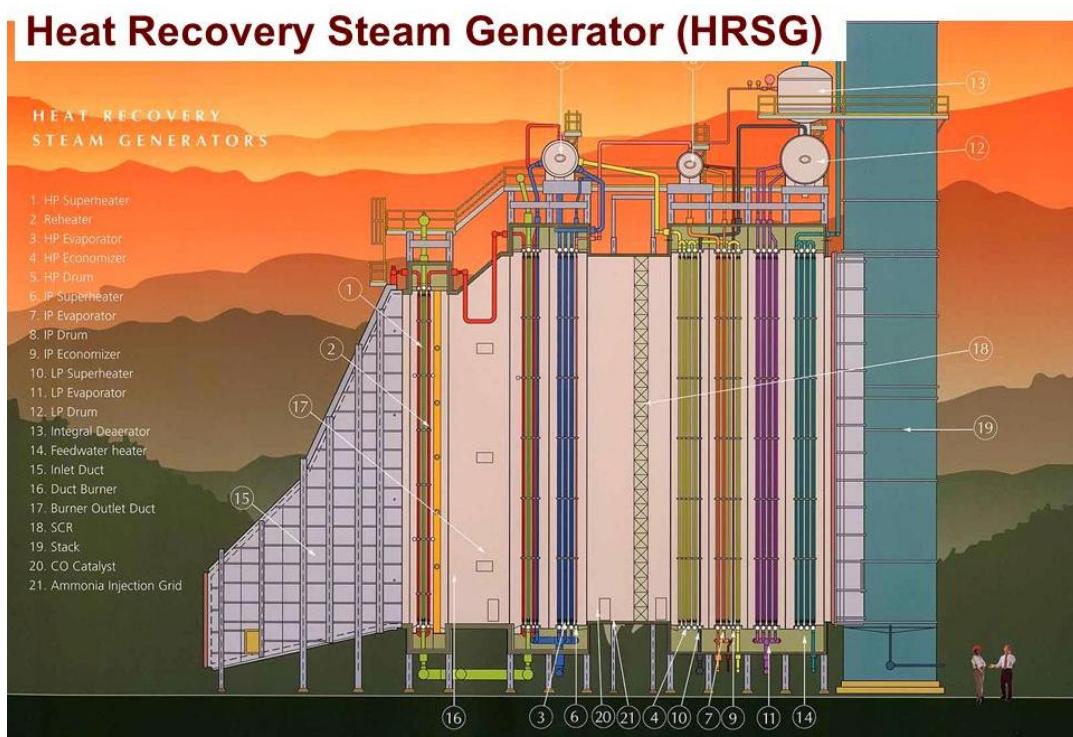

#### ***Horizontal Once-Through***

HRSG tipe *horizontal once-through* merupakan HRSG dengan konsep sama seperti tipe horizontal hanya saja HRSG tipe ini tidak memiliki *drum* sehingga memungkinkan adanya *unlimited daily cycling*. Namun karena itu tipe HRSG ini membutuhkan material yang lebih tahan.

Gambar 2.6 HRSG Horizontal Once-Through  
(Sumber : [gepower.com](http://gepower.com))

### 2.2.2.3. Bagian-Bagian HRSG

Gambar 2.7 Bagian HRSG  
(Sumber : Shepard, 2015)

HRSG terdiri dari beberapa bagian seperti pada gambar 2.5 di atas, yaitu :

#### 1. Reheater/Preheater

*Preheater* merupakan pemanas awal air yang dipompakan dari kondensor sebelum masuk feed water tank, yang bertujuan menaikan suhu sebelum masuk *feed water tank*.

#### 2. Economizer

*Economizer* tersusun dari *tubes* di dalam HRSG yang berfungsi memanaskan air sebelum masuk ke *drum* dan *evaporator* sehingga temperature air telah tinggi

dan lebih mudah diuapkan. Selain itu, jika air yang masuk ke *economizer* lebih sedikit perbedaan temperaturnya, maka *tubes tubes economizer* tidak akan mudah rusak.

### 3. *Evaporator*

*Evaporator* bertugas memanaskan uap air yang berasal dari *steam drum* yang masih dalam fase cair hingga menjadi uap jenuh, yang kemudian akan diteruskan ke *superheater*.

### 4. *Superheater*

*Superheater* merupakan alat yang berfungsi untuk menaikkan temperatur uap jenuh sampai menjadi uap panas lanjut (*superheat vapour*). Uap panas lanjut bila digunakan untuk melakukan kerja dengan jalan ekspansi di dalam turbin atau mesin uap tidak akan mengembun.

### 5. *Steam Drum*

Fungsi utama dari *steam drum* di HRSG adalah untuk memisahkan fase cair dan fase uap/gas yang masing-masing memiliki perbedaan tekanan.

### 6. *Integral Daerator*

*Daerator* berfungsi menghilangkan oksigen dan CO<sub>2</sub> di *feedwater*, untuk memanaskan *feedwater*, dan sebagai storage untuk *daerated feedwater*.

### 7. *Feedwater Heater*

*Feedwater heater* berfungsi memanaskan *feedwater*.

### 8. *Inlet Duct*

*Inlet duct* berfungsi sebagai tempat masuknya *exhaust gas*.

### 9. *Duct Burner*

*Duct burner* merupakan alat yang berfungsi untuk menambah panas gas.

### 10. SCR (*Selective Catalytic Reducer*)

SCR berfungsi mengontrol emisi NOx and Sax.

### 11. *Stack*

*Stack* merupakan tempat keluarnya gas sisa pembakaran HRSG.

### 12. CO *Catalyst*

CO Catalyst berfungsi mengurangi emisi CO.

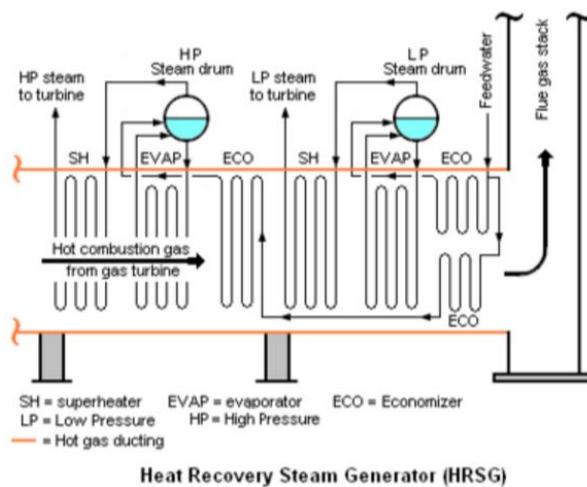

### 13. *Amonia Injection Grid*

*Amonia Injection Grid* berfungsi menghilangkan NO<sub>x</sub>.

#### 2.2.2.4. HRSG Flow Path Description

*Daerated feedwater* masuk ke HRSG melalui *tubes*, demikian juga *exhaust gas* dari PLTG masuk ke dalam HRSG melalui *inlet duct*. *Exhaust gas* memenuhi HRSG dan memanasi *tubes* yang berisi *daerated feedwater*. Setelah mengalami tahapan-tahapan di dalam HRSG maka akan dihasilkan *superheat vapour*, yang akan digunakan untuk menggerakkan turbin, kemudian dikonversikan ke energi listrik. Tahapan HRSG *flow path description* adalah sebagai berikut :

*HP Superheater 1 – Reheater 1 – HP Superheater 2 Reheater 2 – HP Superheater 3 – HP evaporator1 – HP Evaporator- IP Superheater – HP Economizer 1 – LP Superheater – HP Economizer 2 IP Evaporator - HP Economizer 3 –IP Economizer 1 –LP Evaporator – HP Economizer 4- Condensate Feedwater Preheater – Stack.*

Gambar 2.8 Pressure Part Diagram  
(Sumber : Citizendum, 2013)

#### 2.2.3. HRSG Piping System

*Piping system* pada HRSG dibedakan menjadi :

##### 1. *Eksternal Piping*

*Eksternal piping* merupakan *piping* yang berada di luar *casing* HRSG.

Misalnya *piping* pada :

- *HP, IP, LP Steam*
- *HP, IP & LP Feedwater*
- *Hot, Cold Reheat*

##### 2. *Interconnecting Piping*

*Interconnecting piping* merupakan *piping* yang ada di *pressure parts* HRSG. Misalnya *piping system* pada :

- *HP, IP & LP Downcomer*
- *HP, IP, & LP Riser*

### 3. *Trim Piping*

*Trim piping* adalah *piping* dengan OD pipa kurang dari 2,5 inch. Misalnya *piping* pada :

- *Drain Pipes*
- *Fuel Pipes*
- *Spraywater Piping*

### 4. *Vent Piping*

*Vent piping* adalah *piping* yang menghubungkan ke *silencer*. Misalnya *piping* pada :

- *Safety Valve Vent Line*
- *Start Up Vent Line*

## 2.2.4. Beban yang Bekerja pada Sistem Perpipaan

Pada sistem perpipaan terdapat berbagai macam beban yang berbeda jenisnya, yaitu *sustained load*, *occasional load*, dan *expansion load*. Masing-masing beban berasal dari sumber yang berbeda, yang dapat diuraikan seperti dibawah ini :

### 2.2.4.1. *Sustained Load*

Beban *sustain* adalah beban yang bekerja terus menerus pada sistem perpipaan. Beban *sustain* berasal dari beban internal dan beban berat. Beban berat pada *piping system* dapat digolongkan sebagai berikut :

- *Live Load*

*Live load* yang dimaksudkan adalah beban *fluida* yang mengalir pada sistem perpipaan.

- *Dead Load*

*Dead load* yang dimaksud adalah beban dari komponen-komponen yang terdapat pada sistem perpipaan.

Beban berat yang bekerja pada sistem perpipaan akan disalurkan ke *pipe supports*. Sehingga pemodelan *pipe supports* juga merupakan hal penting, agar

dapat dipastikan *pipe supports* dapat menahan beban tersebut. Pemodelan *pipe supports* merupakan bagian dari analisis tegangan pada sistem perpipaan, *pipe supports* yang digunakan umumnya berjenis fixed sehingga tegangan maksimum yang dihasilkan dapat dilihat pada persamaan 2.1 berikut :

$$\sigma = \frac{WL^2}{8Z} \quad (2.1)$$

Dimana

$\sigma$  = tegangan (Pa)

W = berat *piping system* (N)

L = panjang pipa (m)

Z = inersia penampang pipa ( $m^4$ )

#### 2.2.4.2. Occasional Load

Beban *occasional* adalah beban yang jarang terjadi, atau bisa juga diartikan beban yang terjadi hanya kadang-kadang, namun tetap harus diperhitungkan agar sistem perpipaan siap menerima beban tersebut saat beban tersebut terjadi. Beban yang digolongkan ke *occasional load* adalah beban yang terjadi hanya 1-10% dari total periode operasi sistem perpipaan. Yang termasuk *occasional loads* adalah sebagai berikut :

- Fenomena alam yang terjadi, seperti angin topan dan gempa bumi.
- Salju, pada saat turun salju, maka bagian-bagian tertentu pada sistem perpipaan yang terkena salju akan mengalami beban yang berlebih.
- *Unusual plant operation*, beban yang diakibatkan oleh kesalahan yang terjadi saat sistem perpipaan beroperasi.
- *Postulate plant accident*, beban yang diakibatkan apabila terjadi kecelakaan pada sistem perpipaan.

Untuk beban angin dapat dihitung menggunakan persamaan 2.2 berikut :

$$F = \frac{C_d D q}{1000} \quad (2.2)$$

Dimana

F = beban angin (N/m)

$C_d$  = koefisien drag

D = diameter luar pipa (mm)

q = tekanan dinamik ( $N/m^2$ )

#### 2.2.4.3. Expansion Load

*Expansion load* adalah beban akibat ekspansi pipa yang disebabkan oleh adanya *thermal*. Beban ini dikelompokkan menjadi berikut ini :

- Beban ekspansi termal akibat pembatasan gerak oleh *pipe support*.
- Beban termal akibat perbedaan temperatur yang besar dan terjadi dengan cepat sehingga menimbulkan tegangan.
- Beban akibat perbedaan koefisien ekspansi pipa yang terdiri dari material logam yang berbeda.

*Pipe supports* digunakan untuk menahan beban *sustain* dan *occasional*, namun penggunaan *pipe supports* (terutama yang *rigid*) dapat membatasi ekspansi yang terjadi saat temperatur sistem perpipaan naik, sehingga dapat menimbulkan tegangan yang tinggi. Secara umum analisis perhitungan beban termal pada tumpuan menggunakan metode *guide cantilever*, dimana pipa dimodelkan sebagai batang yang dipegang secara rigid pada salah satu ujung, dan pada titik tertentu diberikan tumpuan sehingga dapat dihitung besar gaya pada tumpuan. Gaya dan momen yang terjadi dapat dilihat pada persamaan 2.3 dan 2.4 berikut :

$$P = \frac{12 EI \Delta}{L^3} \quad (2.3)$$

$$M = \frac{6 EI \Delta}{L^2} \quad (2.4)$$

Dimana

P = gaya pada tumpuan (N)

M = momen pada tumpuan (N/m)

E = modulus elastisitas (Pa)

I = momen inersia penampang ( $m^4$ )

$\Delta$  = pertambahan panjang akibat ekspansi termal (m)

L = panjang pipa (m)

#### 2.2.4. Tegangan pada Sistem Perpipaan

Tegangan pada sistem perpipaan terjadi karena beban-beban yang bekerja pada pipa yang telah dijelaskan sebelumnya. Analisa tegangan pada sistem perpipaan dilakukan untuk menjadikan keamanan dari sistem tersebut dalam berbagai kondisi pembebahan, analisis dilakukan dengan memperhitungkan besaran-besaran yang diijinkan, seperti :

- Tegangan yang terjadi pada dinding pipa
- Perpindahan akibat ekspansi pipa

- Beban-beban pada *nozzle*

Tegangan yang terjadi dalam sistem perpipaan dapat dikelompokkan ke dalam dua kategori, yakni Tegangan Normal (*Normal Stress*) dan Tegangan Geser (*Shear Stress*). Tegangan normal terdiri dari tiga komponen yaitu :

1. Tegangan Longitudinal (*Longitudinal Stress*), yaitu tegangan yang searah panjang pipa.

Tegangan Longitudinal merupakan jumlah dari Tegangan Aksial (*Axial Stress*), Tegangan Tekuk (*Bending Stress*) dan Tegangan Tekanan (*Pressure Stress*). Mengenai ketiga tegangan ini dapat diuraikan berikut ini.

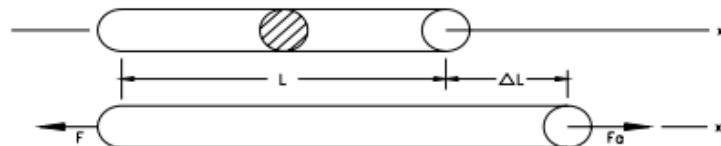

- a. Tegangan Aksial  $\sigma_{ax}$  adalah tegangan yang ditimbulkan oleh gaya  $F_{ax}$  yang bekerja searah dengan sumbu pipa, dan dapat dilihat pada persamaan 2.5 sebagai berikut:

$$\sigma_{ax} = \frac{F_{ax}}{A} \quad (2.5)$$

$$A = \text{luas penampang pipa} \left( \frac{d_o^2 - d_i^2}{4} \right)$$

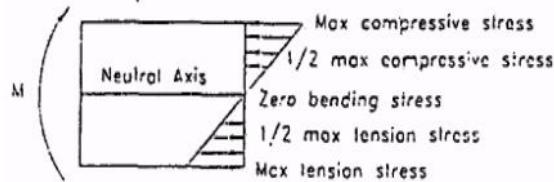

$d_o$  = diameter luar pipa

$d_i$  = diameter dalam pipa

Gambar 2.9 Axial Stress  
(Sumber : Chamsudi, 2005)

- b. Tegangan Tekuk ( $\sigma_b$ ) adalah tegangan yang ditimbulkan oleh momen  $M$  yang bekerja di ujung- ujung pipa. Dalam hal ini tegangan yang terjadi dapat berupa Tegangan Tekuk Tekan (*Tensile Bending*) atau Tegangan Tekuk Tarik (*Compression Bending*). Tegangan tekuk itu maksimum pada permukaan pipa dan nol pada sumbu pipa, karena tegangan tersebut merupakan fungsi jarak dari sumbu ke permukaan pipa, dapat dilihat pada persamaan 2.6 berikut.

Gambar 2.10 Tegangan Tekuk  
(Sumber : Chamsudi, 2005)

$$\sigma_b = \frac{M_c}{I} \quad (2.6)$$

$$I = \text{Momen Inersia Penampang} \left( \frac{\pi (r_o^4 - r_i^4)}{4} \right)$$

- c. Tegangan longitudinal tekan ( $\sigma_{LP}$ ) adalah tegangan yang ditimbulkan oleh gaya tekan internal P yang bekerja pada dinding pipa searah sumbu pipa , yang dilihat pada persamaan 2.7 berikut :

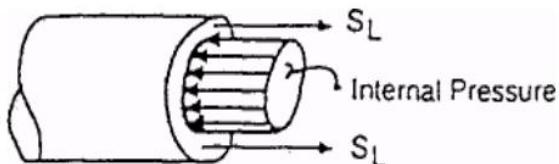

$$\sigma_{LP} = \frac{PA_i}{A_m} = \frac{Pd_i^2}{(d_o^2 - d_i^2)} = \frac{Pd_i^2}{4td_m} = \frac{Pd_o}{4t} \quad (2.7)$$

Dimana

$A_i$  = luas permukaan dalam pipa

$A_m$  = luas rata-rata permukaan pipa

$t$  = tebal pipa

Gambar 2.11 Tegangan Longitudinal Tekan  
(Sumber : Chamsudi, 2005)

Jadi tegangan longitudinal yang bekerja pada sistem perpipaan dapat dinyatakan dengan persamaan 2.8 di bawah ini.

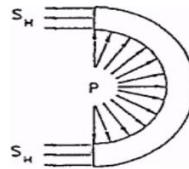

$$\sigma_{LP} = \frac{PA_i}{A_m} = \frac{Pd_i^2}{(d_o^2 - d_i^2)} = \frac{Pd_i^2}{4td_m} = \frac{Pd_o}{4t} \quad (2.8)$$

2. Tegangan Tangensial atau Tegangan Keliling (*Circumferential Stress* atau *Hoop Stress*).

*Hoop Stress* yaitu tegangan yang searah garis singgung penampang pipa. Tegangan tangensial  $\sigma_{SH}$  ditimbulkan oleh tekanan internal yang bekerja secara

tengensial dan besarnya bervariasi tergantung pada tebal dinding pipa. Rumus untuk tegangan tangensial dapat didekati dengan memakai persamaan Lame 2.9 berikut.

$$\sigma_{LP} = \frac{P(r_1^2 + \frac{r_i^2 r_o^2}{r^2})}{(r_o^2 - r_i^2)} \quad (2.9)$$

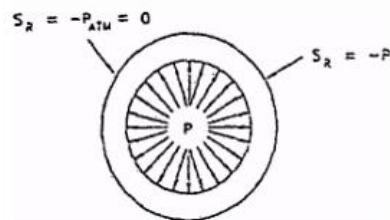

Gambar 2.12 Hoop Stress  
(Sumber Chamsudi, 2005)

### 3. Tegangan Radial (*Radial Stress*)

*Radial Stress* yaitu tegangan searah jari-jari penampang pipa. Besar tegangan ini bervariasi dari permukaan dalam pipa ke permukaan luarnya dan dapat dinyatakan dengan persamaan 2.10 berikut.

$$\sigma_R = \frac{P(r_i^2 - \frac{r_i^2 r_o^2}{r^2})}{(r_o^2 - r_i^2)} \quad (2.10)$$

Tekanan internal tegangan radial maksimum  $\sigma_{\max}$  terjadi pada permukaan dalam pipa dan tegangan minimum  $\sigma_{\min}$  pada permukaan luarnya. Kedua tegangan ini berlawanan dengan tegangan tekuk, sehingga tegangan radial tersebut sangat kecil dibandingkan dengan tegangan tekuk. Jadi tegangan radial dapat diabaikan.

Gambar 2.13 Radial Stress  
(Sumber : Chamsudi, 2005)

Untuk dinding pipa yang tipis persamaan di atas dapat disederhanakan menjadi persamaan 2.11 berikut.

$$\sigma_{SH} = \frac{Pd_i L}{2tL} = \frac{Pd_i}{2t} = \frac{Pd_o}{2t} \quad (2.11)$$

Tegangan Geser terdiri dari dua komponen tegangan, yaitu :

1. Tegangan Geser (*Shear Stress*).

Tegangan akibat gaya geser ini yang bekerja kearah penampang pipa dinyatakan dalam persamaan 2.12 berikut.

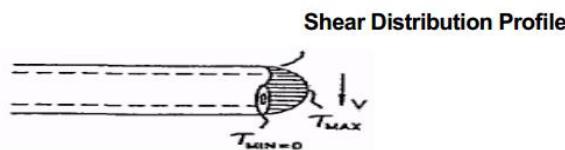

$$\sigma_{max} = \frac{VQ}{A_{max}} \quad (2.12)$$

Dimana

$V$  = gaya geser

$A_{max}$  = luas penampang pipa

$Q$  = *form factor* untuk pergeseran (1.33 untuk penampang lingkaran pejal)

Gambar 2.12 Shear Stress  
(Sumber : Chamsudi, 2005)

Tegangan geser mencapai nilai maksimum pada sumbu pipa dan minimum pada jarak terjauh dari sumbu pipa (yaitu permukaan luar pipa). Seperti halnya pada tegangan radial, besar tegangan geser ini kebalikan dengan tegangan tekuk, sehingga tegangan geser relatif kecil dibandingkan dengan tegangan tekuk, sehingga dapat diabaikan.

2. Tegangan Puntir atau Tegangan Torsi (*Torsional Stress*), yaitu tegangan akibat momen puntir pada pipa.

Suatu bentangan bahan dengan luas permukaan tetap dikenali suatu puntiran (*twisting*) pada setiap ujungnya dan puntiran ini disebut juga dengan torsional, dan bentangan benda tersebut dikatakan sebagai poros (*shaft*). Untuk suatu poros dengan panjang  $L$  dan jari-jari  $c$  dikenali torsi  $T$  (sepasang), sebagaimana ditunjukkan dalam gambar 2.13, Pergeseran sudut (*angular displacement*) ujung satu terhadap yang lainnya diberikan dengan sudut  $\phi$  (dalam radian) dapat dinyatakan seperti pada persamaan 2.13.

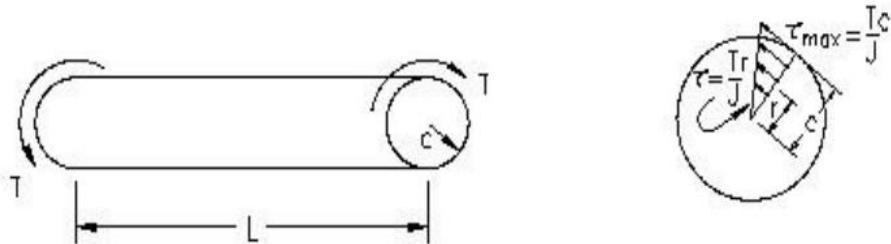

$$\phi = \frac{TL}{JG} \quad (2.13)$$

Dengan  $J = \pi c^4 / 2$  adalah *moment inersia polar* pada luas permukaan. Tegangan geser torsional pada suatu jarak  $r$  dari sumbu poros luas permukaan dapat dinyatakan dengan persamaan 2.14 berikut.

$$\tau = \frac{Tr}{J} \quad (2.14)$$

Maksimum tegangan geser yang terjadi pada  $r = c$  dapat dilihat pada persamaan 2.15.

$$J = \frac{\pi(c_o^2 - c_i^2)}{2} \quad (2.15)$$

Gambar Tegangan Geser Torsinal  
(Sumber : Chamsudi, 2005)

Dari kelima macam tegangan yang terjadi di atas dapat disimpulkan bahwa apabila ada beban luar maupun internal pressure yang bekerja pada system perpipaan, maka pada system perpipaan tersebut akan mengalami tiga macam tegangan yang patut dipertimbangkan, yaitu tegangan longitudinal, tegangan shear torsional dan hoop stress dan dua macam tegangan yang diabaikan yaitu tegangan radial dan tegangan geser.

### 2.2.5. Pipe Supports

Dalam *pipe stress analysis*, didesain *pipe supports* yang sesuai agar *stress* dan *allowable stress piping* tidak melebihi batas yang ditentukan. Adapun dalam *software AutoPIPE* terdapat beberapa jenis *pipe support* seperti berikut ini :

#### a. V-stop

*Rigid support* yang hanya menahan arah vertikal saja. Contohnya : *short rod hanger assemblies (eye sockets, clevises, yokes, clamps, dll), pipe stanchions dan*

*trunnions, saddles, dan short structural steel sections.*

*b. Inclined*

*Support yang menahan beban secara miring. Contoh: wires, sway braces, dan struts.*

*c. Line Stop*

*Support yang hanya menahan pergerakan arah aksial pipa. Contoh: Pipe slides dengan limit stops, dan pipe skirts.*

*d. Guide*

*Support yang hanya menahan pergerakan pipa arah lateral (vertikal dan/atau horizontal). Contoh: pipe guides, roller chairs dan plates, saddles,.*

*e. Rotation*

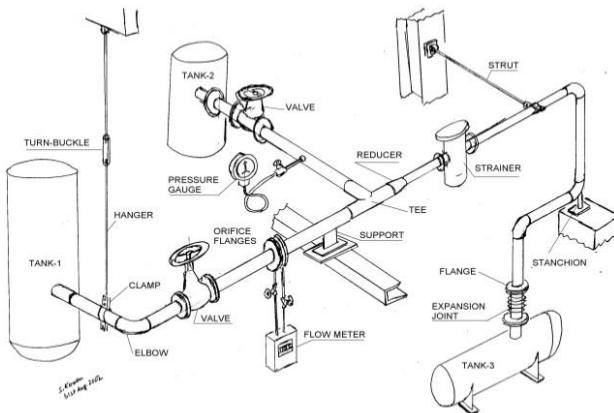

*Support yang hanya menahan pergerakan rotasi/berputar/ dari pipa. Contoh: sleeve pipa yang terbuat dari pipa yang lebih besar (menahan rotasi arah perpendicular pipa).*

*f. Damper*

Tipe *support* ini menahan getaran seismik, tidak menahan beban karena efek gravitasi atau kondisi operasi.

*g. Tie/link*

*Support yang menghubungkan antara dua pipa, atau menghubungkan pipa dengan frame. Contoh: rod hanger assemblies, sway braces, dan restricting struts.*

Gambar 2.14 Beberapa Tipe *Pipe Supports*  
(Sumber : [www.slideshare.net/](http://www.slideshare.net/))

### 2.2.6. Tegangan Ijin ASME B31.1

Tegangan sistem perpipaan tidak boleh melebihi tegangan ijin *code* yang digunakan. Pada kasus ini digunakan ASME B31.1 *Power Piping*, karena sistem

yang dianalisa terdapat di *power generating stations*. Tegangan yang ijin yang digunakan untuk desain *power piping system* dapat dilihat pada tabel lampiran A di ASME B31.1 atau yang disebut Tabel Tegangan Ijin.

- **Tegangan Akibat Beban *Sustain***

Tegangan yang terjadi akibat beban *sustain* seperti tekanan, berat, dan yang lainnya. Dapat dinyatakan dalam persamaan 2.16 dan 2.17 berikut :

(U.S. Customary Units)

$$\left(\frac{PD_0}{4t_n}\right) + \left(\frac{0.75iMa}{Z}\right) \leq 1.0 s_h \quad (2.16)$$

(SI Units)

$$\left(\frac{PD_0}{4t_n}\right) + \left(\frac{0.75iMa}{Z}\right) \leq 1.0 s_h \quad (2.17)$$

Dimana

$i$  = stress intensification factor

$M_A$  = resultant moment loading on cross section due to weight and other sustained loads, in-lb (mm-N)

$S_h$  = basic material allowable stress at maximum (hot) temperature

$S_L$  = sum of the longitudinal stresses due to pressure, weight, other sustained loads

$Z$  = section modulus, in.<sup>3</sup> (mm<sup>3</sup>)

- **Tegangan Akibat Beban *Occasional***

Tegangan yang terjadi akibat adanya kombinasi tekanan, berat, beban sustain yang lain, dan beban *occasional* termasuk gempa dapat dinyatakan dalam persamaan dibawah ini :

(U.S. Customary Units)

$$\left(\frac{PD_0}{4t_n}\right) + \left(\frac{0.75iMa}{Z}\right) + \left(\frac{0.75iMb}{Z}\right) \leq Ks_h \quad (2.18)$$

(SI Units)

$$\left(\frac{PD_0}{4t_n}\right) + 1000 \left(\frac{0.75iMa}{Z}\right) + 1000 \left(\frac{0.75iMb}{Z}\right) \leq Ks_h \quad (2.19)$$

Dimana

$k = 1.15$  for occasional loads acting for no more than 8 hr at any one time and no more than 800 hr/yr

$k = 1.2$  for occasional loads acting for no more than 1 hr at any one time and no more than 80 hr/yr

$M_g$  = resultant moment loading on the cross section due to occasional loads, such as thrusts from relief/safety valve loads, from pressure and flow transients, and earthquake, in.-lb (mm-N)

- **Tegangan Akibat Beban Displacement**

Tegangan yang diakibatkan oleh *thermal expansion* dan beban siklik lainnya, dapat dinyatakan dalam persamaan :

$$S_E = \frac{iM_C}{Z} \leq S_A \quad (2.20)$$

Dimana

$M_C$  = resultant moment loading range on the cross section due to the reference displacement load range. For flexibility analyses, the resultant moment due to the ambient to normal operating load range and eq. (1A) are typically used, in.-lb (mm-N)

- **Moments and Section Modulus**

Persamaan 2.16 – 2.20 digunakan untuk komponen yang lurus, pipa melengkung, siku yang dilas, dapat dihitung dengan persamaan 2.21 berikut :

$$M_j = (M_{xj}^2 + M_{yj}^2 + M_{zj}^2)^{1/2} \quad (2.21)$$

Dimana

$j = A, B, or C$  seperti yang telah dijelaskan pada paragraf sebelumnya

$Z$  = section modulus of piping, in.<sup>3</sup> (mm<sup>3</sup>)

### 2.2.7. Expansion Joint

*Expansion joint* adalah alat yang digunakan untuk memungkinkan pergerakan dalam suatu sistem perpipaan ketika fluida yang melaluinya bertekanan

dan bersuhu tinggi. Kenaikan panas, pergerakan equipment, getaran, atau tekanan sering menyebabkan pergerakan dalam sistem perpipaan. Ketika fleksibilitas untuk meredam pergerakan tersebut tidak didesain ke sistem perpipaan, maka penggunaan expansion joint merupakan solusi ideal.

Dalam sistem perpipaan industri, *expansion joint* sering digunakan untuk mengakomodasi pergerakan akibat perubahan termal dan mekanik dalam sistem. Ketika terjadi suatu proses di dalam plant yang membutuhkan perubahan besar dalam suhu, maka komponen logam akan berubah dimensinya karena pemuaian. Expansion joint dengan bellow dirancang untuk mengakomodasi gerakan tertentu dan meminimalkan transfer gaya dari komponen-komponen sensitif dalam sistem.

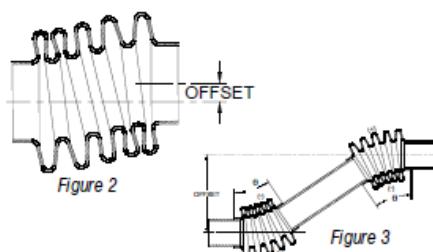

Ada empat pergerakan dasar yang dapat diterapkan pada sebuah *bellow*, yaitu aksial, *lateral*, *angular* dan *torsional*. *Bellow* berperilaku seperti spring dalam sistem perpipaan. Ketika bellow mendapat tekanan maka akan menahan gerakan yang sama seperti spring. *Spring rate* sebuah bellow sepenuhnya tergantung pada geometri *bellow* dan sifat materialnya

- Gerakan aksial adalah perubahan dalam dimensi panjang bellow dari panjang bebas dalam arah sejajar dengan sumbu *longitudinal*.

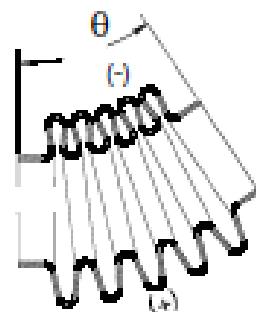

Gambar 2.15 Gerakan Aksial *Bellow*  
(Sumber : Expansion Joints Technical Design Catalog, 2001)

- Gerakan lateral adalah perpindahan relatif dari satu ujung ke ujung *bellow* lain dalam arah tegak lurus terhadap sumbu longitudinal (geser).

Gambar 2.16 Gerakan *Lateral Bellow*  
(Sumber : Expansion Joints Technical Design Catalog, 2001)

- Gerakan angular adalah perpindahan rotasi dari sumbu longitudinal bellow menuju titik rotasi.

Gambar 2.17 Gerakan *Angular Bellow*  
(Sumber : Expansion Joints Technical Design Catalog, 2001)

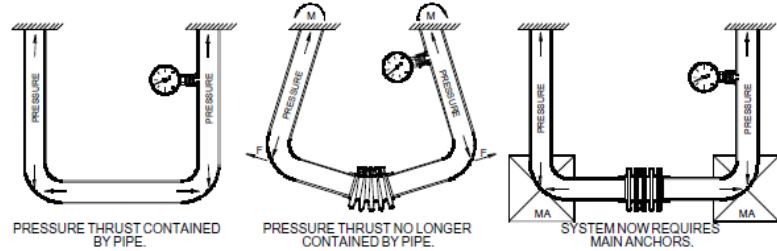

- Gerakan torsional adalah rotasi sumbu yang melalui pusat sebuah bellow

Gambar 2.18 Gerakan *Aksial Bellow*  
(Sumber : Expansion Joints Technical Design Catalog, 2001)

#### *Pressure Test*

Sistem perpipaan dibebani oleh *internal pressure*, maka dinding pipa akan mengalami *circumferential loading* dan *longitudinal loading*. Apabila di pipa dipasang *expansion joint*, maka gaya akibat *longitudinal pressure* harus ditahan oleh pipa. *Pressure thrust* adalah hasil dari *internal pressure* dikalikan dengan *Bellow effective area*. Bila tidak ada *anchor* untuk menyerap *pressure thrust*, maka bisa digunakan *tie rod* untuk menyerap *pressure thrust* tersebut. Tetapi perlu diingat bahwa *Bellow* yang diberi Tie Rod tidak bisa menyerap axial movement.

Gambar 2.19 *Pressure Thrust* pada Pipa  
 (Sumber : Expansion Joints Technical Design Catalog, 2001)

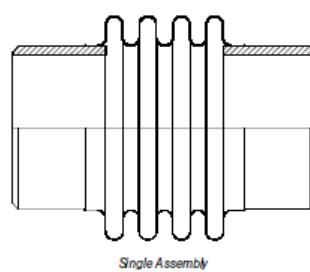

#### *Basic Type of Expansion Joint*

##### *Unrestrained Assemblies*

*Expansion joint* jenis ini bebas bergerak sepanjang sumbu nya. Pressure thrust load akan didistribusikan kepada anchor. *Expansion joint* jenis ini harus menggunakan anchor pada instalasinya.

- *Single Bellows Assembly*

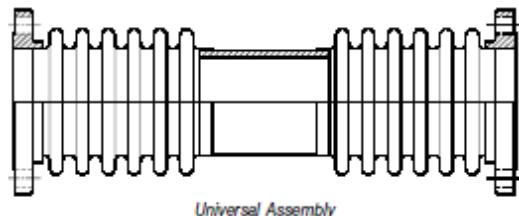

Merupakan tipe *expansion joint* yang paling sederhana yang memiliki *bellows* tunggal yang dilas pada bagian akhirnya biasanya pada bagian *flange* atau pada bagian akhir pipa. *Expansion joint* ini mampu menyerap pergerakan pada arah aksial, lateral dan angular baik secara sendiri-sendiri maupun kombinasi dari ketiga pergerakan tersebut dalam range pergerakan yang kecil.

Gambar 2.20 *Single Assembly*  
 (Sumber : Expansion Joints Technical Design Catalog, 2001)

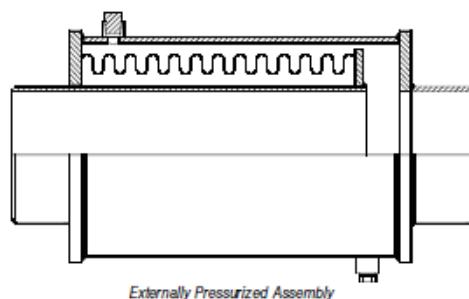

- *Universal Expansion Joint Assembly*

Memiliki dua *bellows* yang dihubungkan oleh sebuah *spool* pipa dengan *flange*. *Expansion joint* ini bisa menyerap pergerakan arah axial, lateral dan angular dalam range pergerakan yang besar.

Gambar 2.21 *Universal Assembly*  
 (Sumber : Expansion Joints Technical Design Catalog, 2001)

- *Externally Pressurized Assembly*

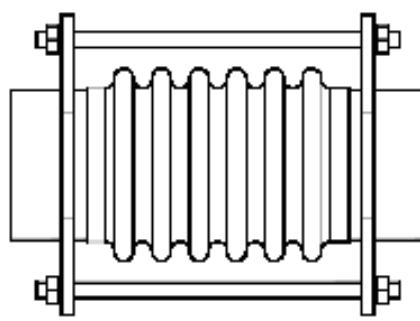

Gambar 2.22 *Externally Pressurized Assembly*  
 (Sumber : Expansion Joints Technical Design Catalog, 2001)

#### *Restrained Assemblies*

*Expansion joint* ini mampu menahan tekanan yang bekerja pada sistem. Dimana dibutuhkan *anchors* untuk mendistribusikan gaya ketika *Expansion joint* dibelokan.

- *Tied Single Bellows Assembly*

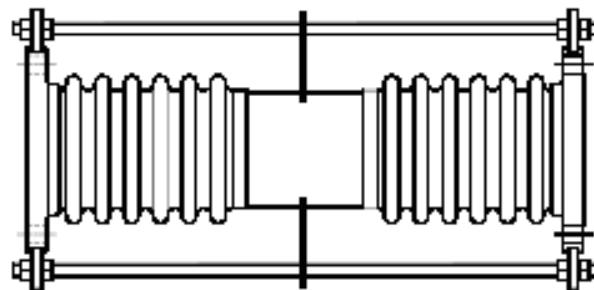

*Expansion joint* jenis ini hanya menyerap pergerakan pada arah lateral dalam range pergerakan yang kecil karena adanya tambahan *tie roads* yang di pasang pada pipa.

Gambar 2.23 *Tied Single Bellows Assembly*  
 (Sumber : Expansion Joints Technical Design Catalog, 2001)

- *Tied Universal Assembly*

*Tied Universal Expansion Joint* bisa mengakomodir pergerakan pada arah lateral dalam range yang cukup besar. Penambahan *tie rods* mengurangi kemampuan untuk menahan tekanan secara lateral dan angular.

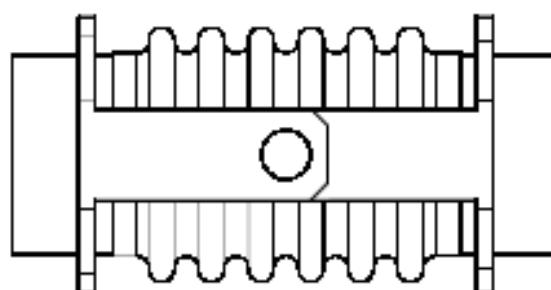

*Tied Universal Assembly*

Gambar 2.24 *Tied Universal Expansion*

(Sumber : Expansion Joints Technical Design Catalog, 2001)

- *Hinged Bellows Assembly*

*Expansion Joint* jenis ini digunakan untuk menyerap rotasi angular hanya pada satu bidang saja. Hinges yang ada pada *Expansion Joint* ini berfungsi untuk menahan pressure thrust load dan beban luar lain seperti angin dan beban mati. Dalam penggunaanya, *Hinged Expansion Joint* bisa digunakan sekaligus 2 buah, guna menyerap movement yang besar

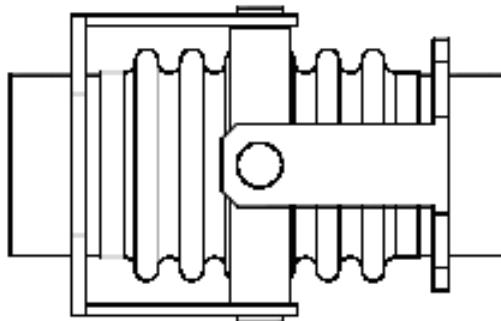

*Hinged Assembly*

Gambar 2.25 *Hinged Bellows Assembly*

(Sumber : Expansion Joints Technical Design Catalog, 2001)

- *Gimbal Bellows Assembly*

*Gimbal Expansion Joint* digunakan untuk meyerap pergerakan angular pada semua bidang/semua arah. *Hinge* dan *Gimbal ring* digunakan untuk menahan pressure thrust load dan beban luar lain seperti beban mati dan beban angin.

*Gimbal Assembly*

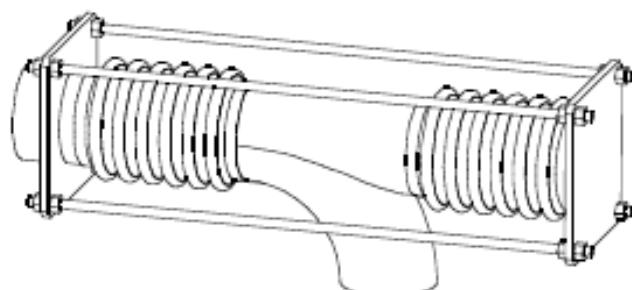

Gambar 2.26 *Gimbal Expansion Assembly*

(Sumber : Expansion Joints Technical Design Catalog, 2001)

- *Pressure Balanced Elbow Assembly*

*Expansion Joint* jenis ini mampu mengabsorb pergerakan arah axial dan lateral dan sekaligus mampu menahan pressure thrust load.

*Expansion Joint* jenis ini hanya bisa digunakan pada bagian pipa yang mengalami perubahan arah (*elbow*)

*Pressure Balanced Elbow Assembly*

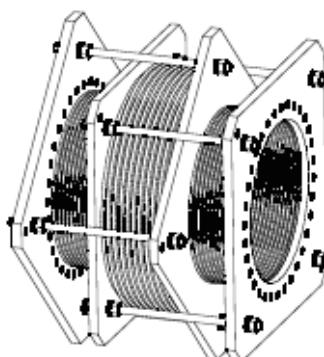

Gambar 2.27 *Pressure Balanced Elbow Assembly*

(Sumber : Expansion Joints Technical Design Catalog, 2001)

- *In-Line Pressure Balanced Assembly*

Pada *Expansion Joint* jenis ini, terdapat 2 jenis *bellow* , yaitu *Line Bellow* dan *Balancing bellow* yang berfungsi untuk

menyeimbangkan *bellow*. Bila *line bellow* terkompresi, maka untuk menyerap kompresi tersebut, *balancing bellow* akan berekspansi sejumlah pergerakan kompresi tersebut. Sehingga volume sepanjang *Expansion Joint* akan tetap sama dengan demikian pressure thrust load tidak akan terbentuk. *Expansion Joint* jenis ini digunakan pada pipa lurus dan terletak diantara 2 anchor guna mengkompensasi pergerakan axial dari pipa, *Expansion Joint* jenis ini juga dapat mengakomodasi sedikit pergerakan arah lateral.

### 2.2.8. Metode Elemen Hingga

Metode elemen hingga merupakan prosedur numerik yang dapat diterapkan untuk memperoleh solusi dari berbagai macam masalah dalam bidang keteknikan (Saeed Moaveni, 1999). Sehingga dapat diartikan jika metode elemen hingga merupakan pendekatan numerik yang digunakan untuk memperoleh solusi dari permasalahan teknik. Langkah pertama dalam menganalisa menggunakan metode elemen hingga adalah dikritisasi/*meshing* dan pemilihan jenis elemen, yaitu pemilihan jenis elemen berkaitan dengan idealisasi struktur yang dimodelkan. Pilihan berkaitan dengan jenis elemen (pilihan dimensi yang ada) lalu dilanjut tingkat kesulitan dari jenis lemen (ditunjukkan dengan jumlah titik yang ada di elemen dan jumlah derajat kebebasan dari masing-masing titik). Penentuan jumlah elemen berkaitan dengan ukuran elemen yang berpengaruh pada deformasi, regangan, serta tegangan yang akan terjadi pada struktur yang dimodelkan, tiap struktur memiliki bentuk geometri, beban, dan syarat batas.

Langkah kedua adalah memilih *displacement function* yang terkait dengan jumlah titik dalam satu elemen serta derajat kebebasan yang dimodelkan pada tiap titik atau derajat polinomial dalam asumsi fungsi deformasi dalam elemen tersebut. Langkah ketiga menentukan persamaan hubungan antara regangan dan deformasi, serta antara tegangan dan regangan. Persamaan regangan dan tegangan dapat dilihat pada persamaan 2.22 dan 2.23 berikut.

$$\text{Regangan : } \boldsymbol{\varepsilon}_x = \frac{du}{dx}, \boldsymbol{\varepsilon}_y = \frac{dv}{dy}, \boldsymbol{\varepsilon}_z = \frac{dw}{dz} \quad (2.22)$$

$$\text{Tegangan : } \sigma_x = E\varepsilon_x, \sigma_y = E\varepsilon_y, \sigma_z = E\varepsilon_z \quad (2.23)$$

Kemudian dilanjutkan dengan langkah keempat yaitu menentukan matrik persamaan dan kekakuan elemen. Terdapat tiga metode dalam penentuan persamaan kekakuan elemen :

- Metode Kesetimbangan Langsung

Matrik persamaan elemen yang menunjukkan hubungan antara gaya, kekakuan, dan deformasi pada elemen ditentukan berdasarkan pada prinsip kesetimbangan gaya.

- Metode Kerja

Pendekatan yang dapat mencakup hampir semua tingkat kerumitan suatu model seperti komponen material, dimensi, beban, dan syarat batas.

- Metode dengan Pemberatan pada Energi Sisa

Metode yang memberikan hasil yang sama untuk semua penyelesaian metode energi, metode ini sebagai penyelesaian saat metode energi tidak bisa digunakan, metode ini dapat mengadopsi langsung persamaan diferensial. Metode ini yang paling terkenal adalah metode Galerkin.

Persamaan elemen yang dihasilkan secara umum dapat dilihat pada persamaan 2.24 berikut.

$$\begin{Bmatrix} f_1 \\ f_2 \\ f_3 \\ \dots \\ f_4 \end{Bmatrix} = \begin{bmatrix} k_{11} & \dots & k_{1n} \\ k_{21} & \dots & k_{2n} \\ k_{31} & \dots & k_{3n} \\ \dots & \dots & \dots \\ k_{n1} & \dots & k_{nn} \end{bmatrix} \begin{Bmatrix} d_1 \\ d_2 \\ d_3 \\ \dots \\ d_n \end{Bmatrix} \text{ atau } \{f\} = [k]\{d\} \quad (2.24)$$

Dimana

$\{f\}$  = matrik gaya

$[k]$  = matrik kekakuan

$\{d\}$  = matrik deformasi

Langkah kelima adalah penggabungan persamaan elemen pembentuk persamaan global atau total dari sistem dan menentukan syarat batas. Penggabungan persamaan elemen dilakukan dengan prinsip superposisi dengan mempergunakan prinsip kontinyuitas dan kompatibilitas. Penyelesaian dari derajat kebebasan yang tak diketahui setelah syarat batas diberikan, persamaan dari sistem menjadi berikut.

$$\begin{Bmatrix} F_1 \\ F_2 \\ F_3 \\ \dots \\ F_n \end{Bmatrix} = \begin{bmatrix} K_{11} & \dots & K_{1n} \\ K_{21} & \dots & K_{2n} \\ K_{31} & \dots & K_{3n} \\ \dots & \dots & \dots \\ K_{n1} & \dots & K_{nn} \end{bmatrix} \begin{Bmatrix} d_1 \\ d_2 \\ d_3 \\ \dots \\ d_n \end{Bmatrix} \quad (2.25)$$

Dimana

N = jumlah derajat kebebasan yang tak diketahui

Matrik  $[K]$  bersifat *non-singular* ( $\det[K] \neq 0$ )

Penyelesaian umumnya antara lain menggunakan metode eliminasi Gauss, Iterasi Gauss-Seidel, dan seterusnya. Langkah ketujuh adalah penyelesaian regangan dan tegangan elemen, hasil regangan dan tegangan adalah *output* yang umum digunakan untuk menentukan kualitas dari desain struktur. Langkah terakhir yaitu interpretasi hasil, *output* yang berupa deformasi, tegangan dan regangan adalah acuan dari penilaian model sehingga dari hasil analisa maka dapat ditentukan perubahan untuk perbaikan desain atau model.

Konsep analisis dengan metode elemen hingga banyak digunakan untuk beberapa *software* seperti AutoPIPE, ANSYS, Nastran, dan lain-lain. Proses analisis elemen hingga sendiri merupakan proses pendekatan numerik dengan membagi geometri menjadi beberapa elemen-elemen. Berikut adalah tahapan sederhana aplikasi metode elemen hingga pada *software*.

1. Pemodelan
2. Pendefinisian material
3. Pembagian menjadi beberapa elemen (*meshing*)

4. Memilih *boundary condition* (gaya, tekanan, *temperature*, percepatan, dan lain-lain)
5. *Post processing* atau hasil (tegangan, regangan, kecepatan fluida, laju aliran fluida, dan lain-lain).

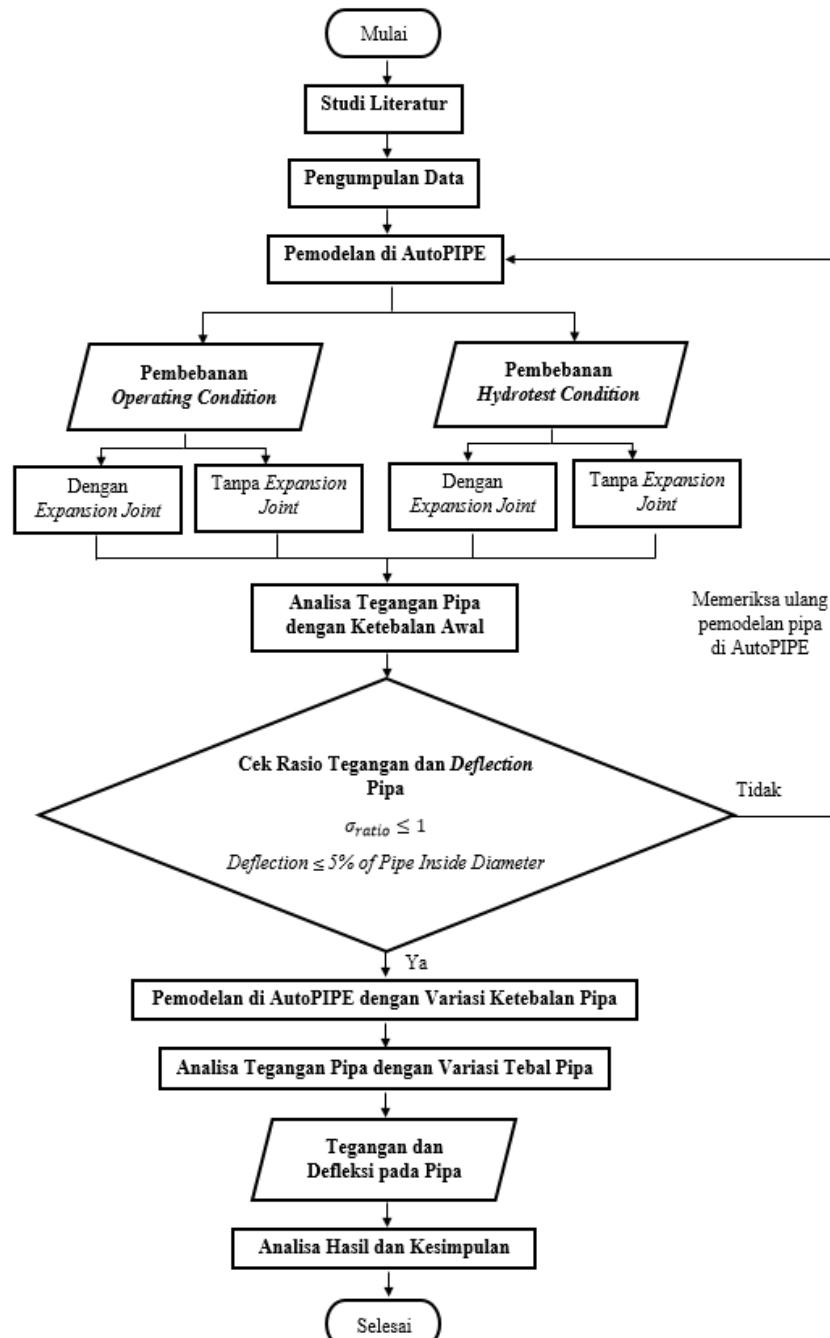

Seperti konsep metode elemen hingga yang telah dijelaskan, *software* AutoPIPE juga diawali dengan memodelkan sistem perpipaan yang akan dianalisa, kemudian penentuan material dan *boundary condition* dari sistem, sehingga dari analisa akan didapatkan tegangan, regangan, *deflection*, dan lain-lain.

## BAB III

### METODOLOGI PENELITIAN

#### 3.1 Diagram Alir Penelitian

Langkah-langkah penggerjaan Tugas Akhir ini secara garis besar dapat dilihat pada Gambar 3.1 berikut.

Gambar 3.1 Diagram Alir Penggerjaan Tugas Akhir

## 3.2 Prosedur Penelitian

Berdasarkan Gambar 3.1, prosedur yang digunakan dalam penelitian ini adalah sebagai berikut:

### 1. Studi Literatur

Pada tahap ini dilakukan studi mengenai pengetahuan dan teori-teori yang berkaitan dengan *piping stress analysis* yang diperoleh dari berbagai penelitian yang telah dilakukan sebelumnya, buku, diktat, dan berbagai sumber internet.

### 2. Pengumpulan Data

Pada tahap ini peneliti mengumpulkan data-data *blowdown tank line pipe* yang akan dianalisa. Data yang dibutuhkan adalah sebagai berikut :

- Gambar Isometrik
- Data Pipa
- Data Angin dan Seismik
- Data *Expansion Joint*

### 3. Pemodelan di AutoPIPE

Pada tahap ini dilakukan pemodelan *blowdown tank line pipe* pada AutoPIPE sesuai dengan data yang desain awal, namun pada salah satu model dihilangkan *expansion joint*-nya untuk melihat hasil tegangan pada pipa yang tidak menggunakan *expansion joint*.

### 4. Pembebanan

Pada tahap ini dilakukan *input* beban sesuai dua kondisi yaitu *operating condition* dan *hydrotest*.

### 5. Analisa Tegangan Pipa dengan Ketebalan Awal

Pada tahap ini dilakukan analisa tegangan pada semua model yang telah dibuat di AutoPIPE.

### 6. Cek Rasio Tegangan dan *Deflection*

Pada tahap ini dilakukan pengecekan rasio tegangan dan defleksi pipa, tegangan dan defleksi tidak boleh melebihi *allowable*.

### 7. Pemodelan di AutoPIPE dengan Variasi Ketebalan Pipa

Pada tahap ini dilakukan pemodelan *blowdown tank line pipe* pada AutoPIPE sesuai dengan variasi tebal pipa dengan deviasi terbesar.

8. Analisa Tegangan Pipa dengan Variasi Tebal Pipa

Pada tahap ini dilakukan analisa tegangan pada semua model yang telah divariasikan ketebalannya.

9. Penutup

Pada tahap ini dilakukan pembahasan dari hasil analisa di *software* AutoPIPE untuk kemudian ditarik kesimpulannya.

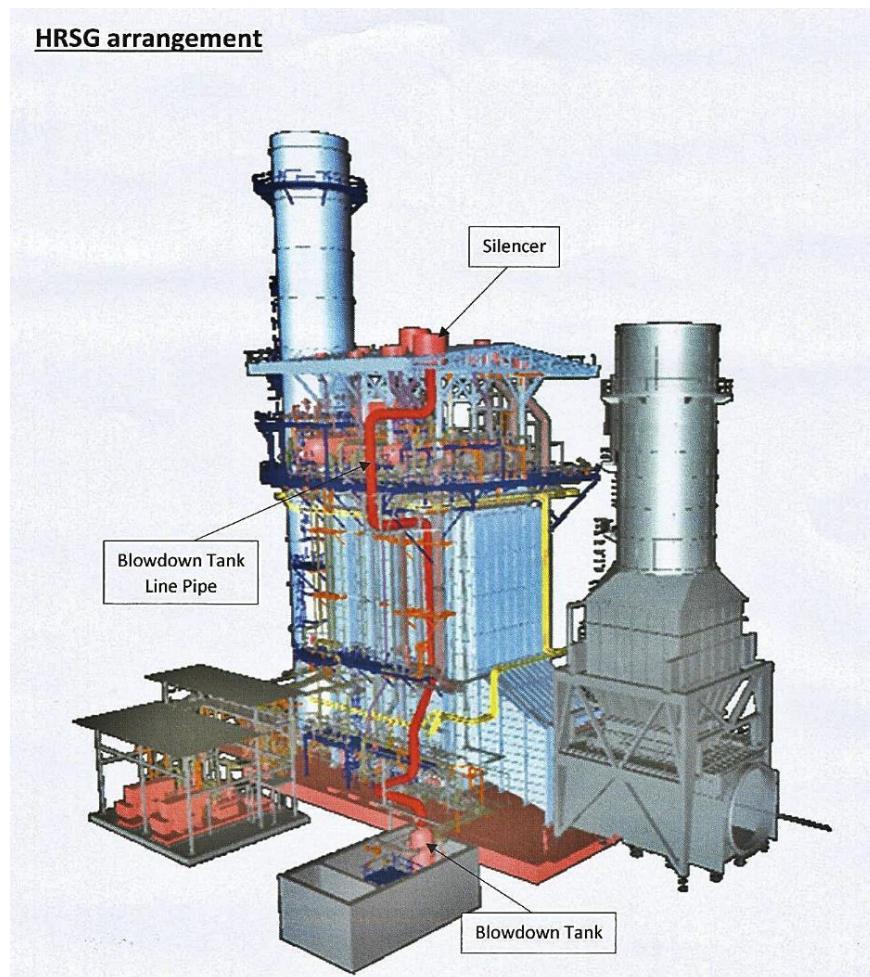

**(Halaman ini sengaja dikosongkan)**

## BAB IV

### ANALISIS DAN PEMBAHASAN

#### 4.1 Pengumpulan Data

Pada Tugas Akhir ini dilakukan analisa tegangan pada *blowdown tank line pipe* di *Heat Recovery Steam Generator* (HRSG) milik PT X. Posisi dan rute dari *blowdown tank line pipe* di HRSG dapat dilihat pada Gambar 4.1 berikut ini, bagian yang di-*high light* berwarna merah merupakan *blowdown tank line pipe*.

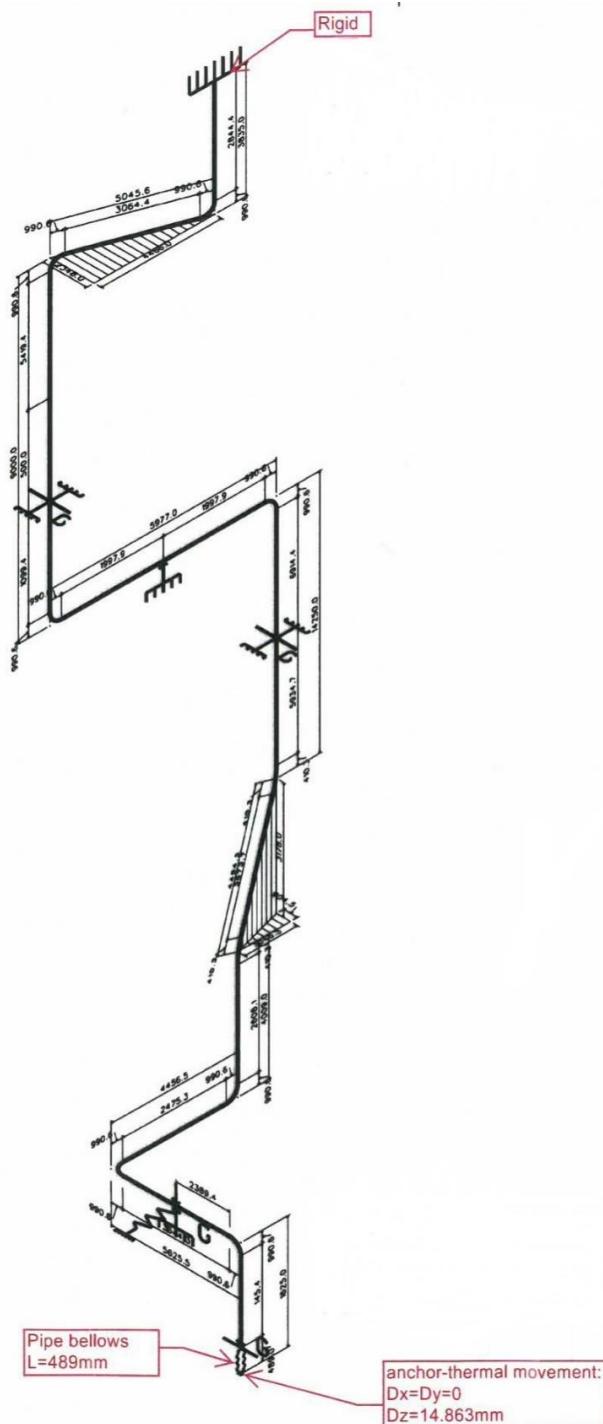

Gambar 4.1 *Heat Recovery Steam Generator* (HRSG) PT X

(Sumber : Dokumen PT X, 2017)

##### 4.1.1 *Piping Isometric Drawing*

*Piping isometric drawing* merupakan hal yang penting untuk menganalisa tegangan pada sistem perpipaan karena merepresentasikan *rooting* dari pipa yang

akan dianalisis secara tiga dimensi, skala pada *isometric drawing* skala sebenarnya hanya berfungsi menunjukkan posisi atau arah dari pipa dalam posisi sebenarnya. *Isometric drawing* untuk *blowdown tank line pipe* dapat dilihat pada Gambar 4.2.

#### Gambar 4.2 Isometric Drawing Blowdown Tank Line Pipe

(Sumber : Dokumen PT X, 2017)

#### **4.1.2 Pipe Properties**

Data *pipe properties* untuk *blowdown tank line pipe* HRSG PT X dapat dilihat pada Tabel 4.1 berikut.

Tabel 4.1 *Pipe Properties*

Pipe Properties		
Description	Nilai	Satuan
Nominal Pipe Size	650	mm
Pipe Schedule	9,525	mm

#### **4.1.3 Material Properties**

Material yang digunakan adalah ASTM A 106 *Carbon Steel Pipe Grade B*. ASTM A106 pipe (*also covered in ASME specifications as S/A 106*) is the standard specification for seamless carbon steel pipe for high-temperature service. Dengan *wall thickness* 19,525 mm. Material ini memiliki *tensile strength* 60.000 psi atau 415 Mpa, dan *yield strength* 35.000 psi atau 240 Mpa.

#### **4.1.4 Corrosion Allowance**

*Corrosion allowance* untuk *blowdown tank vent* milik PT X adalah 1,6 mm.

#### **4.1.5 Data Pembebaan pada Hydrotest Condition**

*Hydrotest* dilakukan untuk menguji pipa terhadap tekanan yang melebihi dari tekanan saat kondisi operasi, pada saat tes ini pipa dialiri air. Data pada saat *operating condition* dapat dilihat pada Tabel 4.2 berikut.

Tabel 4.2 Data *Operating Condition*

Description		Unit
Pressure	1,5	N/mm <sup>2</sup>
Temperature	25	C
Spesific Gravity	1	
Pipe Insulation	0	mm

#### **4.1.6 Data Pembebaan pada Operating Condition**

Setelah dilakukan *hydrotest*, sistem perpipaan akan beroperasi pada suhu dan temperature tertentu. Data pada saat *operating condition* dapat dilihat pada Tabel 4.3.

Tabel 4.3 Data *Operating Condition*

<i>Description</i>		<i>Unit</i>
<i>Pressure</i>	0,35	N/mm <sup>2</sup>
<i>Temperature</i>	304	C
<i>Spesific Gravity</i>	0,002	
<i>Pipe Insulation</i>	80	mm
<i>Insulation Density</i>	128	Kg/m <sup>3</sup>

#### 4.1.7 Data Beban Lingkungan

Dalam beroperasi atau saat sedang dilakukan *hydrotest* sistem perpipaan pasti menerima beban lingkungan (*occasional loads*). Data untuk *seismic* sebesar 0,24 G, sedangkan untuk data beban angin dapat dilihat pada Tabel 4.4.

Tabel 4.4 Data *Wind Loads*

Data Angin		
<i>Elevation</i> 0 m	648,21	N/m <sup>2</sup>
<i>Elevation</i> 15 m	889,95	N/m <sup>2</sup>
<i>Elevation</i> 30 m	984,39	N/m <sup>2</sup>
<i>Elevation</i> 40 m	1016,93	N/m <sup>2</sup>

#### 4.1.8 Data *Expansion Joint*

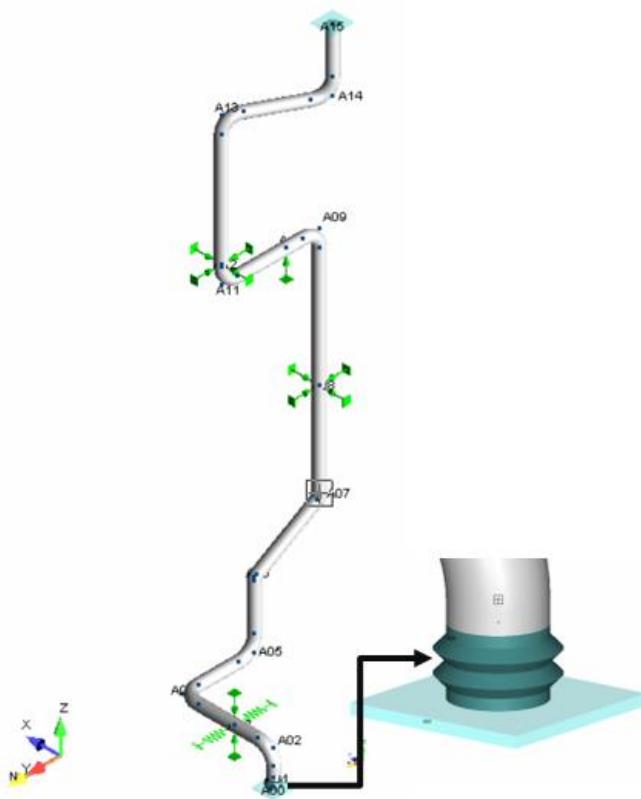

Pada *blowdown tank line pipe* digunakan *expansion joint* di dekat *anchor* sistem perpipaan, *expansion joint* yang digunakan adalah produk EJS dengan data yang dapat dilihat pada Gambar 4.3 berikut.

* Add 0.25" to OAL for vanstone option with liner.				

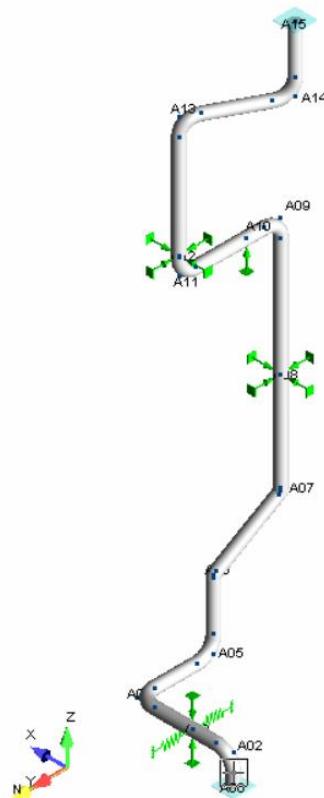

Gambar 4.3 Data Expansion Joint pada Blowdown Tank Line Pipe  
(Sumber : *Expansion Joints Technical Design Catalog*, 2001)

#### 4.2 Pemodelan di AutoPIPE

Sebelum dilakukan analisa tegangan, perlu dilakukan pemodelan *line pipe* sesuai dengan *isometric drawing*-nya. Penulis memodelkan *blowdown tank line pipe* menggunakan *software* AutoPIPE. *Line pipe* yang dimodelkan menggunakan *anchor* di kedua ujungnya untuk mewakili *nozzle* dan *silencer* yang ada di ujung-ujungnya. Pemodelan dilakukan dengan memasukkan data *pipe properties* seperti *nominal diameter*, *schedule*, *corrosion allow*, *spesific gravity*, *pipe material*, *insulation thickness and density*. Setelah memasukkan *pipe properties*, lalu dimasukkan *temperature and pressure*, karena analisa dilakukan pada dua kondisi yaitu *operating* dan *hydrotest*, maka untuk *input temperature*, *pressure*, *pipe insulation*, dan *spesific gravity* disesuaikan dengan data pada kondisi masing-masing. Setelah itu mulai dibuat pemodelan *line pipe* sesuai dengan *route*, *pipe supports*, *expansion joint* sesuai data. Hasil dari pemodelan *blowdown tank line pipe* yang sesuai dengan data (menggunakan *expansion joint*) pada AutoPIPE dapat dilihat pada Gambar 4.4, sedangkan untuk pemodelan *blowdown line pipe* setelah *expansion joint* dihilangkan dapat dilihat pada Gambar 4.5.

Gambar 4.4 Pemodelan *Blowdown Line Pipe* dengan *Expansion Joint*

Gambar 4.5 Pemodelan *Blowdown Line Pipe* Tanpa *Expansion Joint*

### 4.3 Pembebanan

Pada analisa yang akan dilakukan juga turut diperhitungkan beban lingkungan, beban yang dimaksud adalah seismik dan beban angin. Beban seismik sebesar 0,24 g di-input-kan dengan variasi arah  $x$ ,  $-x$ ,  $y$ , dan  $-y$ , sedangkan untuk beban angin di-input-kan sesuai ketinggian dan tekanan angin dengan variasi arah  $x$ ,  $-x$ ,  $y$ , dan  $-y$ . Untuk lebih jelasnya dapat dilihat kotak dialog untuk memasukkan *seismic loads* (Gambar 4.6) dan kotak dialog untuk memasukkan *wind loads* (Gambar 4.7).

	Case	Seismic Code	Vertical Factor	X (g)	Y (g)	Z (g)	
	E1	User		0.2400	0.0000	0.0000	
	E2	User		-0.2400	0.0000	0.0000	
	E3	User		0.0000	0.2400	0.0000	
	E4	User		0.0000	-0.2400	0.0000	

Gambar 4.6 Kotak Dialog *Static Earthquake*

Case	Type	Wind Direction
W1	Profile	Global X
W2	Profile	Global -X

Base Height (mm)	To	Height (mm)	Pressure (N/m <sup>2</sup> )
Ground	To	15000.000	648.210
15000.000	To	30000.000	889.950
30000.000	To	40000.000	984.390
40000.000	To	Highest	1016.930

Gambar 4.7 Kotak Dialog *Wind and Wind Profile*

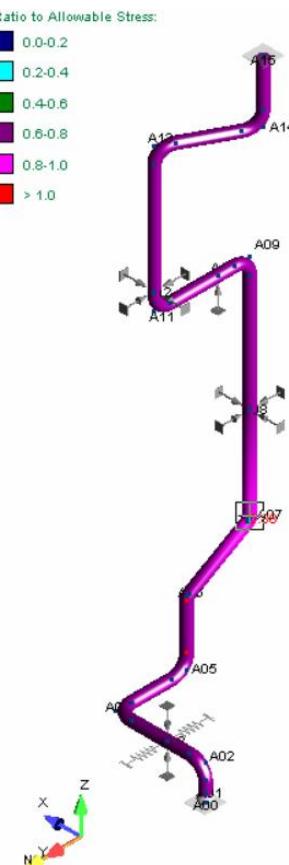

Setelah semua beban dimasukkan, maka dipilih *static analysis sets* untuk memilih beban-beban mana saja yang akan diberikan pada model *blowdown tank line pipe* untuk dianalisa tegangannya. Pada analisa Tugas Akhir ini *pressure*, *temperature*, dan semua *earthquake and wind cases* diberikan pada model di AutoPIPE, sehingga tegangan yang diakibatkan oleh kombinasi-kombinasi dari beban yang telah dipilih dapat dilihat di hasil analisis *software*.

#### 4.4 Analisa Tegangan Pipa dengan Ketebalan Awal

Hasil analisa tegangan didapatkan dari *stress analysis* pada model di AutoPIPE, berikut adalah hasil tegangan maksimal di *blowdown tank line pipe* pada *operating and hydrotest condition*.

##### 4.4.1. Tegangan pada *Hydrotest Condition* (Dengan *Expansion Joint*)

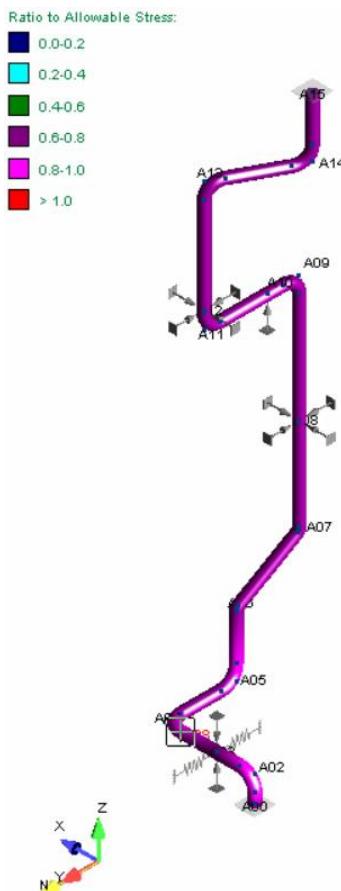

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa rasio tegangan dapat dilihat pada Gambar 4.8 berikut.

Gambar 4.8 Rasio Tegangan *Blowdown Tank Vent* pada *Hydrotest Condition* (Dengan *Expansion Joint*)

#### 4.4.2. Tegangan pada *Hydrotest Condition* (Tanpa Expansion Joint)

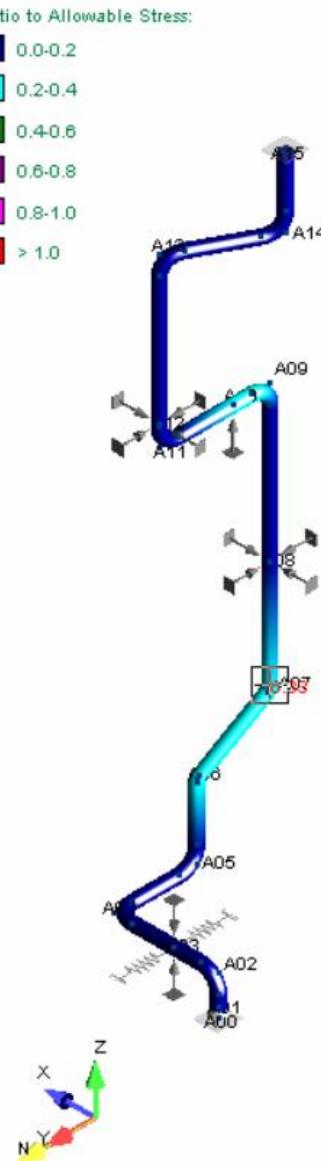

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang tidak menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.9 berikut.

Gambar 4.9 Rasio Tegangan *Blowdown Tank Vent* pada *Hydrotest Condition* (Tanpa Expansion Joint)

#### 4.4.3. Tegangan pada *Operating Condition* (Dengan Expansion Joint)

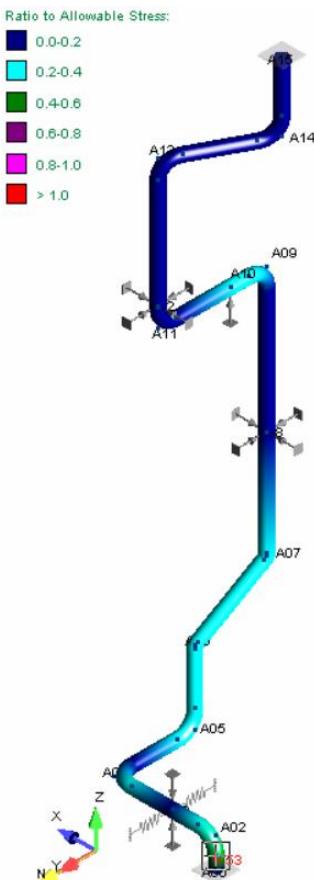

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang menggunakan *expansion joint* pada *operating condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.10 berikut.

Gambar 4.10 Rasio Tegangan *Blowdown Tank Vent* pada *Operating Condition*  
(Dengan *Expansion Joint*)

#### 4.4.4. Tegangan Maksimal pada *Operating Condition* (Tanpa *Expansion Joint*)

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang tidak menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.11 berikut.

Gambar 4.11 Tegangan *Blowdown Tank Vent* pada *Hydrotest Condition* (Tanpa Expansion Joint)

*Maximum sustained stress, allowable sustained stress, dan rasio sustained stress* hasil analisa pada bab 4.4.1 hingga bab 4.4.2 dapat dilihat pada Tabel 4.5 berikut.

Tabel 4.5 *Sustained Stress Blowdown Vent Pipe* pada Ketebalan Pipa Awal

Sustained Stress (Hydrotest Condition)									
Menggunakan Expansion Joint					Tanpa Expansion Joint				
Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads	Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads
A07 F	104,19	117,90	0,88	GR + Max P{1}	A06 F	86,26	117,90	0,73	GR + Max P{1}

A07 F	46,12	141,48	0,33	Sus. + E3{1}	A06 N	41,41	141,48	0,29	SUS. + W1 {1}

*Maximum hoop stress, allowable hoop stress, dan rasio hoop stress* hasil analisa pada bab 4.4.1 hingga bab 4.4.2 dapat dilihat pada Tabel 4.8 berikut.

Tabel 4.8 Hoop Stress Blowdown Vent Pipe pada Ketebalan Pipa Awal

Hoop Stress (Hydrotest Condition)									
Menggunakan Expansion Joint					Tanpa Expansion Joint				
Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads	Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads
A06 N	72,95	117,90	0,62	Max P{1}	A02 N	72,95	117,90	0,62	Max P{1}
Hoop Stress (Operating Condition)									
Menggunakan Expansion Joint					Tanpa Expansion Joint				
Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads	Point	Stress (N/mm <sup>2</sup> )	Allowable (N/mm <sup>2</sup> )	Ratio	Loads
A07 F	17,02	117,90	0,14	Max P{1}	A02 N	17,02	117,90	0,14	Max P{1}

#### 4.5 Cek Rasio Tegangan dan Deflection Pipa

Dari hasil analisa *maximum stress* pada kondisi *hydrotest* dan *operating* sebelumnya, didapatkan rasio tegangan terbesar adalah 0,98 sehingga dapat disimpulkan bahwa pada ketebalan desain pipa yaitu 9,525 mm *blowdown tank vent* masih aman karena di bawah 1. Sedangkan untuk defleksi, menurut ASME B31.1 *allowable pipe deflection* adalah 5% dari *pipe inside diameter*.

Diketahui pipa memiliki diameter 650 mm dengan tebal 9,525 mm, maka *allowable pipe deflection* adalah 32,02 mm. Pada Tabel 4.9 dapat dilihat *maximum displacement* pada analisa pipa *blowdown tank vent*, dengan *displacement* terbesar 15,59 mm sehingga dapat disimpulkan pipa aman.

Tabel 4.9 Maximum Displacement Blowdown Vent Pipe pada Ketebalan Pipa Awal Dengan Expansion Joint

Keterangan	Point	Maximum Displacement (mm)			
		Dx	Dy	Dz	Total
Hydrotest Condition	A05	-2,77	-3,85	-4,73	6,7
Operating Condition	A05	-6,39	-9,02	-10,91	15,53

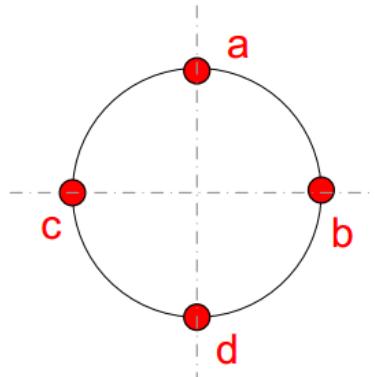

#### 4.6 Pemodelan di AutoPIPE dengan Variasi Ketebalan Pipa

Pada tahap ini, dilakukan model pipa yang telah dibuat divariasikan ketebalannya. Berikut adalah data uji *pipe thickness*, lokasi pengambilan uji *thickness* diprioritaskan dengan memperhatikan hal-hal berikut:

- Lokasi pipa dengan area terbuka, sehingga berisiko terjadi korosi akibat air hujan atau lainnya.

- b. Lokasi pipa dengan beban kritis seperti sambungan *elbow*, *tee*
- c. Lokasi pipa sebelum dan sesudah *valve*

Pada tiap lokasi uji, diambil empat titik *sample* seperti pada Gambar 4.12 berikut.

Gambar 4.12 Penampang Uji *Thickness* Pipa

Tabel 4.10 Hasil Uji *Thickness* (*Selected*)

Material A-106 Gr. B				
Initial Thickness	Titik Uji	Hasil Uji <i>Thickness</i> (mm)	Deviasi (%)	
9,525	a	8,501	10,75	
	b	7,989	16,13	
	c	10,754	-12,9	
	d	10,139	-6,45	
9,525	a	10,242	-7,53	
	b	8,808	7,53	
	c	10,344	-8,6	
	d	9,696	-1,8	

Variasi ketebalan pipa akibat korosi dimodelkan dengan menganggap ketebalan pipa akibat korosi sama pada semua titik. Dari data pada Tabel 4.10 dapat dilihat jika deviasi pipa terbesar adalah 16,13%; 10,75%; dan 7,53%. Maka dibuatlah model *blowdown tank vent* dengan variasi ketebalan sebesar 7,989 mm; 8,501 mm; dan 8,808 mm. Namun perlu diingat bahwa apabila pemodelan dilakukan dengan menganggap penipisan pada pipa sama pada semua titik tentunya hasil pemodelan kurang mewakili kondisi *real* korosi yang terjadi pada pipa di lapangan, sehingga pemodelan yang lebih baik perlu memperhatikan beda ketebalan pipa pada berbagai titik (tidak dilakukan pada penelitian ini). Pada analisa tegangan dengan variasi ketebalan pipa akibat korosi ini, pemodelan dilakukan pada

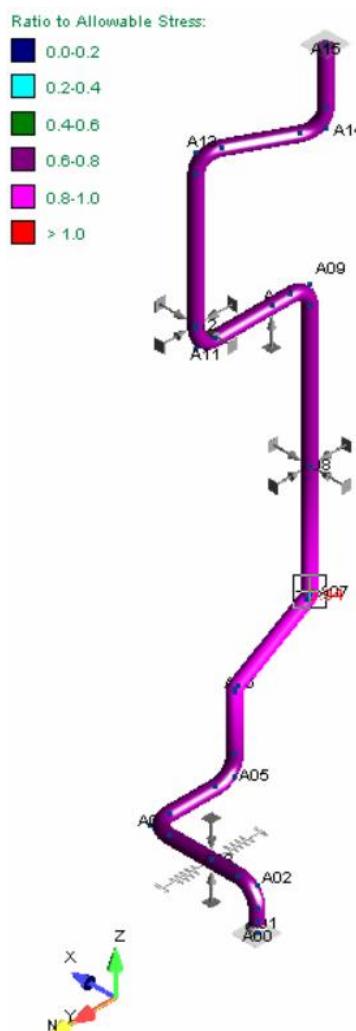

kondisi *hydrotest* dan *operating*, dengan menggunakan *expansion joint* dan tanpa menggunakan *expansion joint*.

#### 4.7 Analisa Tegangan Pipa dengan Ketebalan Variasi Ketebalan Pipa

Hasil analisa tegangan didapatkan dari *stress analysis* pada model di AutoPIPE, berikut adalah hasil tegangan maksimal di *blowdown tank line pipe* pada *operating and hydrotest condition* dengan ketebalan pipa yang telah divariasikan.

##### 4.7.1. Tegangan pada *Hydrotest Condition* (Dengan *Expansion Joint, Pipe Thickness 8,808 mm*)

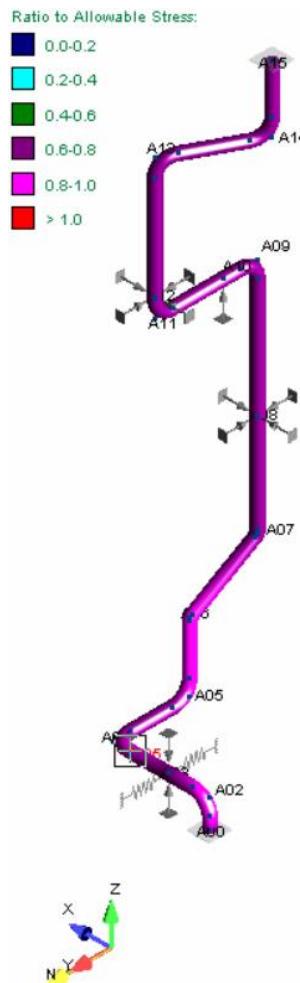

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa rasio tegangan dapat dilihat pada Gambar 4.13 berikut.

Gambar 4.13 Rasio Tegangan *Blowdown Tank Vent* pada *Hydrotest Condition* (Dengan *Expansion Joint, Pipe Thickness 8,808 mm*)

#### **4.7.2. Tegangan pada *Hydrotest Condition* (Tanpa Expansion Joint, Pipe Thickness 8,808 mm)**

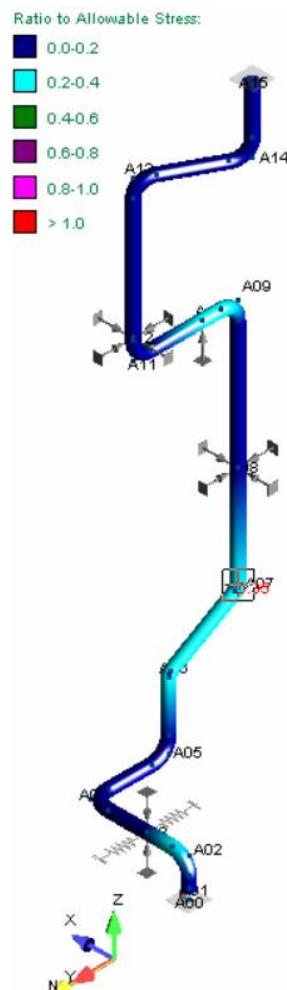

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang tidak menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.14 berikut.

Gambar 4.14 Rasio Tegangan *Blowdown Tank Vent* pada *Hydrotest Condition* (Tanpa Expansion Joint, Pipe Thickness 8,808 mm)

#### **4.7.3. Tegangan pada *Operating Condition* (Dengan Expansion Joint, Pipe Thickness 8,808 mm)**

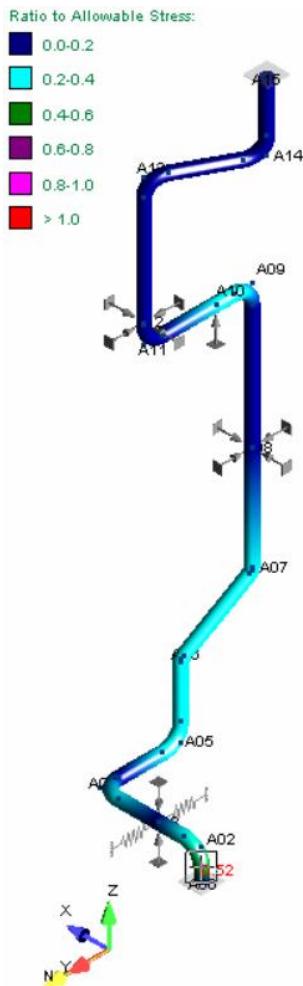

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang menggunakan *expansion joint* pada *operating condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.15 berikut.

Gambar 4.15 Rasio Tegangan *Blowdown Tank Vent* pada *Operating Condition*  
(Dengan *Expansion Joint*, Pipe Thickness 8,808 mm)

#### 4.7.4. Tegangan Maksimal pada *Operating Condition* (Tanpa *Expansion Joint*, Pipe Thickness 8,808 mm)

Berikut adalah tegangan maksimal hasil dari analisa tegangan *blowdown tank vent* yang tidak menggunakan *expansion joint* pada *hydrotest condition*. Hasil analisa tegangan dapat dilihat pada Gambar 4.16 berikut.

Gambar 4.16 Tegangan Blowdown Tank Vent pada Hydrotest Condition (Tanpa Expansion Joint, Pipe Thickness 8,808 mm)

*Maximum sustained stress, allowable sustained stress, dan rasio sustained stress* hasil analisa pada bab 4.7.1 hingga bab 4.7.4 dapat dilihat pada Tabel 4.11 berikut.

Tabel 4.11 Sustained Stress Blowdown Vent Pipe pada Ketebalan Pipa 8,808 mm

Sustained Stress (Hydrotest Condition)

A07 F	21,3	117,90	0,18	Max P{1}	A02 N	21,3	117,90	0,18	Max P{1}

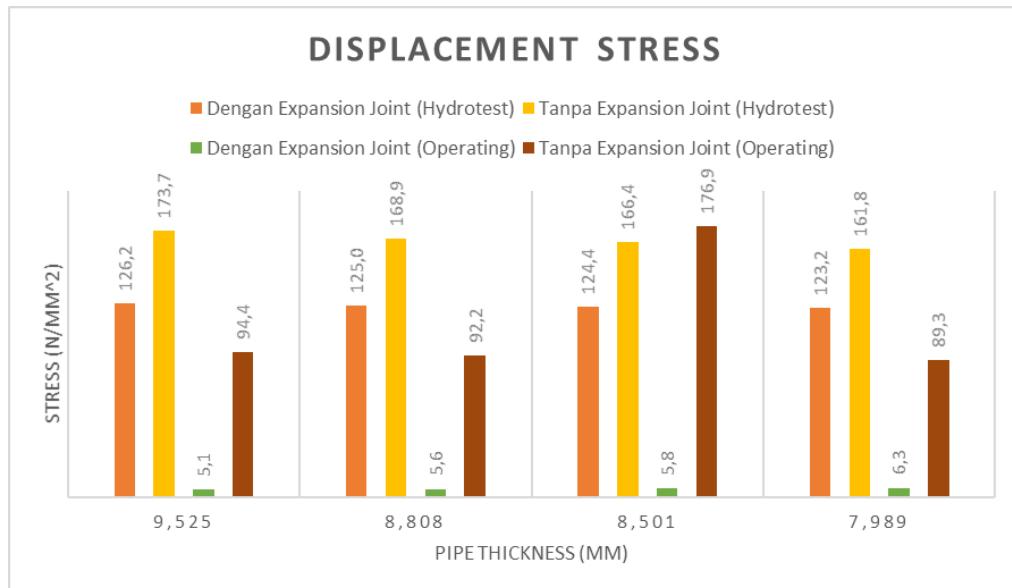

Grafik yang terjadi pada *blowdown tank vent* hasil analisa di *software AutoPIPE* untuk semua variasi dapat dilihat pada Gambar 4.25 berikut.

Gambar 4.25 *Sustained Stress* Hasil Analisa Semua Variasi

Dari Gambar 4.25 di atas dapat dilihat jika *sustained stress* mengalami kenaikan seiring menipisnya ketebalan pipa, penggunaan *expansion joint* pada pipa menyebabkan *sustained stress* naik, dan *sustained stress* yang terjadi pada pipa lebih besar saat *hydrotest condition* daripada saat *operating condition*.

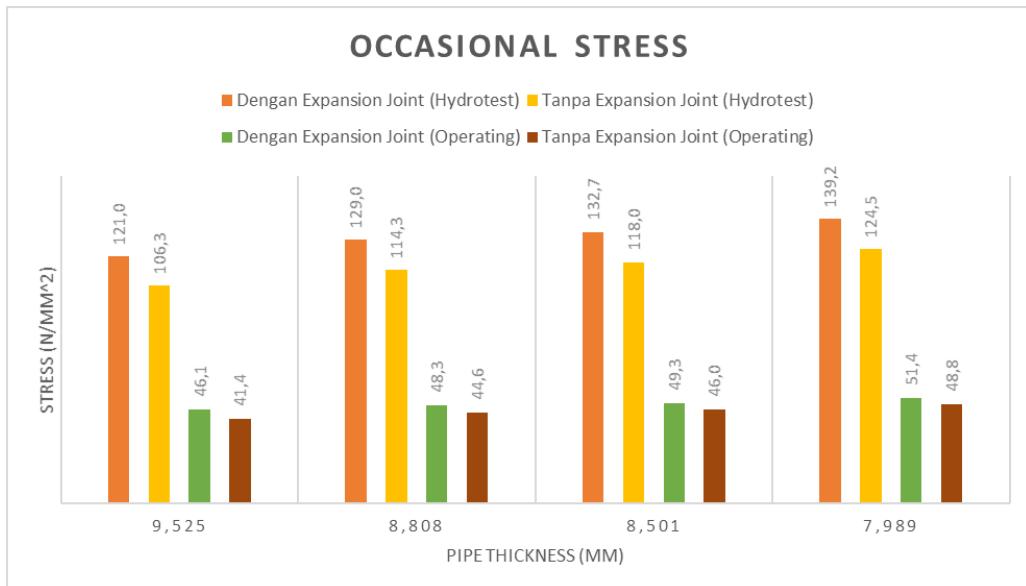

Grafik *displacement stress* yang terjadi pada *blowdown tank vent* hasil analisa di *software AutoPIPE* untuk semua variasi dapat dilihat pada Gambar 4.26 berikut.

Gambar 4.26 *Displacement Stress* Hasil Analisa Semua Variasi

Dari Gambar 4.26 di atas dapat dilihat jika *displacement stress* mengalami penurunan seiring menipisnya ketebalan pipa, penggunaan *expansion joint* pada pipa menyebabkan *displacement stress* turun, dan *displacement stress* yang terjadi pada pipa lebih besar saat *hydrotest condition* daripada saat *operating condition*.

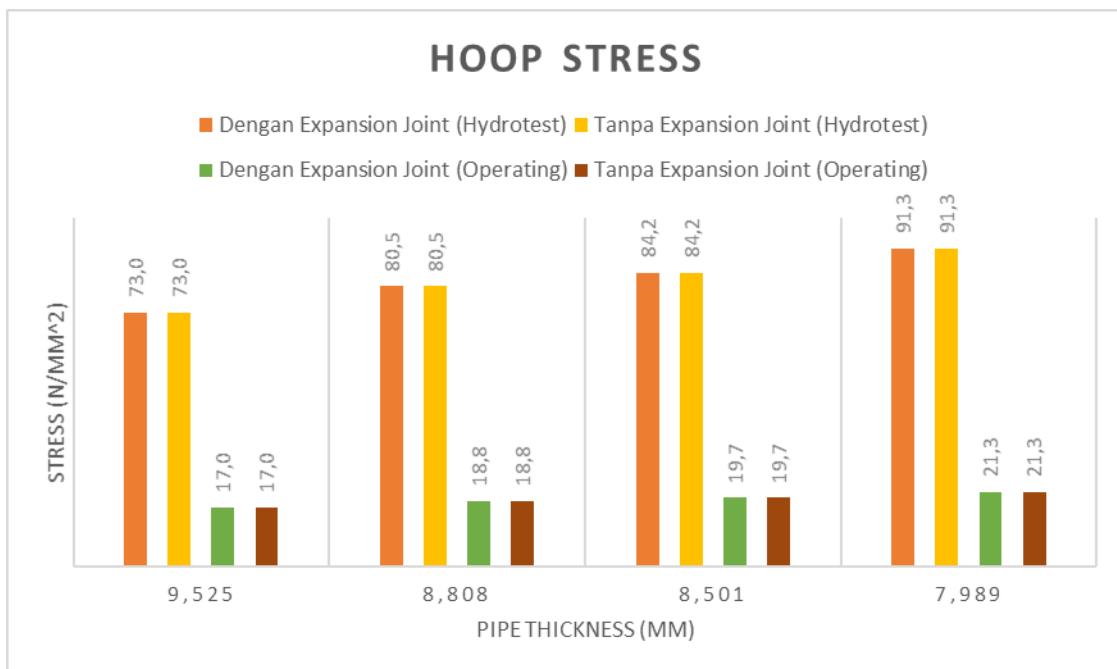

Grafik *occasional stress* yang terjadi pada *blowdown tank vent* hasil analisa di software AutoPIPE untuk semua variasi dapat dilihat pada Gambar 4.27 berikut.

Gambar 4.27 *Occasional Stress* Hasil Analisa Semua Variasi

Dari Gambar 4.27 di atas dapat dilihat jika *occasional stress* mengalami kenaikan seiring menipisnya ketebalan pipa, penggunaan *expansion joint* pada pipa menyebabkan *occasional stress* naik, dan *occasional stress* yang terjadi pada pipa lebih besar saat *hydrottest condition* daripada saat *operating condition*.

Grafik *hoop stress* yang terjadi pada *blowdown tank vent* hasil analisa di *software AutoPIPE* untuk semua variasi dapat dilihat pada Gambar 4.28 berikut.

Gambar 4.28 *Hoop Stress* Hasil Analisa Semua Variasi

Dari Gambar 4.28 di atas dapat dilihat jika *hoop stress* mengalami kenaikan seiring menipisnya ketebalan pipa, penggunaan *expansion joint* tidak berpengaruh pada *hoop stress* yang terjadi pada pipa, dan *hoop stress* yang terjadi pada pipa lebih besar saat *hydrottest condition* daripada saat *operating condition*.

## BAB V

### PENUTUP

#### 5.1 Kesimpulan

Dari analisa dan pembahasan pada Bab IV yang dilakukan dalam Tugas Akhir ini, didapatkan beberapa kesimpulan sebagai berikut:

1. Penggunaan *expansion joint* menyebabkan turunnya *displacement stress*.
2. Menipisnya ketebalan pipa menyebabkan naiknya *sustained, occasional*, dan *hoop stress*, namun *displacement stress* justru mengalami penurunan.
3. Tegangan pipa pada *hydrotest condition* lebih besar daripada tegangan pipa saat *operating condition*.

#### 5.2 Saran

Berikut ini adalah beberapa hal yang dapat dijadikan saran untuk penelitian selanjutnya yang berhubungan dengan Tugas Akhir ini:

1. Pada penelitian selanjutnya perlu dianalisa *local stress* yang terjadi pada pipa, khususnya setelah pipa mengalami korosi.
2. Pada penelitian selanjutnya dapat dilakukan analisa dengan variasi penggunaan *pipe support* yang tentunya sangat berpengaruh pada tegangan yang terjadi pada pipa.
3. Pada penelitian selanjutnya data korosi dan *as build drawing* dapat dilakukan dengan melakukan pengukuran langsung dari lapangan jika memang memungkinkan.
4. Pada penelitian selanjutnya dapat dilakukan analisa dengan pemodelan ketebalan pipa yang berbeda pada tiap titiknya, sehingga dapat mewakili kondisi *real* pipa di lapangan.

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```

Point : A06 F
Stress N/mm2 : 92.78
Allowable N/mm2 : 117.90
Ratio : 0.79
Load combination : GR + Max P{1}

```

#### Maximum displacement stress ratio

```

Point : A04 N
Stress N/mm2 : 168.88
Allowable N/mm2 : 176.85
Ratio : 0.95
Load combination : Max Range

```

#### Maximum occasional stress ratio

```

Point : A06 F
Stress N/mm2 : 114.33
Allowable N/mm2 : 141.48
Ratio : 0.81
Load combination : Sus. + E1{1}

```

#### Maximum hoop stress ratio

```

Point : A02 N
Stress N/mm2 : 80.50
Allowable N/mm2 : 117.90
Ratio : 0.68
Load combination : Max P{1}

```

## R E S U L T      S U M M A R Y

### Maximum sustained stress ratio

```
Point : A06 F
Stress N/mm2 : 95.79
Allowable N/mm2 : 117.90
Ratio : 0.81
Load combination : GR + Max P{1}
```

### Maximum displacement stress ratio

```
Point : A04 N
Stress N/mm2 : 166.44
Allowable N/mm2 : 176.85
Ratio : 0.94
Load combination : Max Range
```

### Maximum occasional stress ratio

```
Point : A06 F
Stress N/mm2 : 118.01
Allowable N/mm2 : 141.48
Ratio : 0.83
Load combination : Sus. + E1{1}
```

### Maximum hoop stress ratio

```
Point : A02 N
Stress N/mm2 : 84.24
Allowable N/mm2 : 117.90
Ratio : 0.71
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A06 F
Stress N/mm2 : 101.10
Allowable N/mm2 : 117.90
Ratio : 0.86
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A04 N
Stress N/mm2 : 161.82
Allowable N/mm2 : 176.85
Ratio : 0.91
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A06 F
Stress N/mm2 : 124.48
Allowable N/mm2 : 141.48
Ratio : 0.88
Load combination : Sus. + E1{1}
```

#### Maximum hoop stress ratio

```
Point : A02 N
Stress N/mm2 : 91.29
Allowable N/mm2 : 117.90
Ratio : 0.77
Load combination : Max P{1}
```

\* \* \* The system satisfies ASME B31.1 (2014) code requirements \* \* \*
\* \* \* for the selected options

## R E S U L T      S U M M A R Y

### Maximum sustained stress ratio

```
Point : A07 F
Stress N/mm2 : 39.10
Allowable N/mm2 : 117.90
Ratio : 0.33
Load combination : GR + Max P{1}
```

### Maximum displacement stress ratio

```
Point : A07 N
Stress N/mm2 : 5.08
Allowable N/mm2 : 176.85
Ratio : 0.03
Load combination : Max Range
```

### Maximum occasional stress ratio

```
Point : A07 F
Stress N/mm2 : 46.12
Allowable N/mm2 : 141.48
Ratio : 0.33
Load combination : Sus. + E3{1}
```

### Maximum hoop stress ratio

```
Point : A07 F
Stress N/mm2 : 17.02
Allowable N/mm2 : 117.90
Ratio : 0.14
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A07 F
Stress N/mm2 : 41.00
Allowable N/mm2 : 117.90
Ratio : 0.35
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A07 N
Stress N/mm2 : 5.59
Allowable N/mm2 : 176.85
Ratio : 0.03
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A07 F
Stress N/mm2 : 48.28
Allowable N/mm2 : 141.48
Ratio : 0.34
Load combination : Sus. + E3{1}
```

#### Maximum hoop stress ratio

```
Point : A07 F
Stress N/mm2 : 18.78
Allowable N/mm2 : 117.90
Ratio : 0.16
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A06 F
Stress N/mm2 : 33.92
Allowable N/mm2 : 117.90
Ratio : 0.29
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A02 N
Stress N/mm2 : 92.20
Allowable N/mm2 : 176.85
Ratio : 0.52
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A06 N
Stress N/mm2 : 44.55
Allowable N/mm2 : 141.48
Ratio : 0.31
Load combination : Sus. + W1{1}
```

#### Maximum hoop stress ratio

```
Point : A02 N
Stress N/mm2 : 18.78
Allowable N/mm2 : 117.90
Ratio : 0.16
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A07 F
Stress N/mm2 : 41.88
Allowable N/mm2 : 117.90
Ratio : 0.36
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A07 N
Stress N/mm2 : 5.84
Allowable N/mm2 : 176.85
Ratio : 0.03
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A07 F
Stress N/mm2 : 49.27
Allowable N/mm2 : 141.48
Ratio : 0.35
Load combination : Sus. + E3{1}
```

#### Maximum hoop stress ratio

```
Point : A07 F
Stress N/mm2 : 19.66
Allowable N/mm2 : 117.90
Ratio : 0.17
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A06 F
Stress N/mm2 : 34.81
Allowable N/mm2 : 117.90
Ratio : 0.30
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A02 N
Stress N/mm2 : 91.16
Allowable N/mm2 : 176.85
Ratio : 0.52
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A06 N
Stress N/mm2 : 46.04
Allowable N/mm2 : 141.48
Ratio : 0.33
Load combination : Sus. + W1{1}
```

#### Maximum hoop stress ratio

```
Point : A02 N
Stress N/mm2 : 19.66
Allowable N/mm2 : 117.90
Ratio : 0.17
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A07 F
Stress N/mm2 : 43.45
Allowable N/mm2 : 117.90
Ratio : 0.37
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A07 N
Stress N/mm2 : 6.28
Allowable N/mm2 : 176.85
Ratio : 0.04
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A07 F
Stress N/mm2 : 51.44
Allowable N/mm2 : 141.48
Ratio : 0.36
Load combination : Sus. + W1{1}
```

#### Maximum hoop stress ratio

```
Point : A07 F
Stress N/mm2 : 21.30
Allowable N/mm2 : 117.90
Ratio : 0.18
Load combination : Max P{1}
```

### R E S U L T      S U M M A R Y

#### Maximum sustained stress ratio

```
Point : A06 F
Stress N/mm2 : 36.42
Allowable N/mm2 : 117.90
Ratio : 0.31
Load combination : GR + Max P{1}
```

#### Maximum displacement stress ratio

```
Point : A02 N
Stress N/mm2 : 89.28
Allowable N/mm2 : 176.85
Ratio : 0.50
Load combination : Max Range
```

#### Maximum occasional stress ratio

```
Point : A06 N
Stress N/mm2 : 48.77
Allowable N/mm2 : 141.48
Ratio : 0.34
Load combination : Sus. + W1{1}
```

#### Maximum hoop stress ratio

```
Point : A02 N
Stress N/mm2 : 21.30
Allowable N/mm2 : 117.90
Ratio : 0.18
Load combination : Max P{1}
```

## BIODATA PENULIS

Nur Kholifah lahir pada 04 Juli 1996 di Kota Surabaya merupakan anak terakhir dari empat bersaudara. Penulis menempuh pendidikan tingkat dasar di SDN Siwalankerto I/418, kemudian menempuh pendidikan tingkat menengah pertama di SMP Negeri 3 Surabaya, dilanjutkan tingkat menengah atas di SMA Negeri 16 Surabaya, dan kemudian Penulis mulai menempuh pendidikan di S-1 di Departemen Teknik Kelautan, Fakultas Teknologi Kelautan, Institut Teknologi Sepuluh Nopember (ITS) Surabaya pada tahun 2014. Selama menempuh masa perkuliahan, Penulis aktif di berbagai kegiatan organisasi dan kepanitiaan. Penulis pernah menjadi Pemandu Samudera 8 FTK ITS, Kepala Divisi *Entrepreneur Development* HIMATEKLA FTK ITS 2016/2017, Ketua Acara Seminar Nasional OCEANO 6, Staff Ahli *Sponsorship* ITS EXPO 2016, dan Ketua Divisi Acara OCEANO 2017. Selain itu Penulis juga aktif di berbagai kegiatan sosial, Penulis pernah menjadi Pengajar Tangguh ITS Mengajar *for Indonesia Batch 3* selama satu bulan mengajar di Tuban, Jawa Timur. Penulis memiliki pengalaman kerja menjadi pengajar privat di salah satu Lembaga Bimbingan Belajar dan pengalaman kerja praktek di Departemen *Piping* PT General Electric Power Indonesia selama dua bulan. Penulis mengakhiri masa perkuliahan dengan membuat Tugas Akhir yang berjudul “Pengaruh Penggunaan *Expansion Joint* Terhadap Tegangan Sistem Perpipaan *Heat Recovery Steam Generator (HRSG)*”.
