**SURAT KEPUTUSAN  
PENGERJAAN TUGAS AKHIR  
(LS 1336)**

Sebagai salah satu syarat untuk mendapatkan gelar Sarjana Teknik pada Jurusan Teknik Sistem Perkapalan, Fakultas Teknologi Kelautan ITS, maka perlu diterbitkan Surat Keputusan Pengerjaan Tugas Akhir yang memberikan tugas kepada mahasiswa tersebut dibawah untuk mengerjakan Tugas sesuai judul dan lingkup bahasan yang telah ditentukan.

Nama Mahasiswa : Pevi Wahyudi

Nrp. : 4201 100 028

Dosen pembimbing : 1. Dr. Ketut Buda Artana, ST, MSc  
2. R.O. Saut Gurning, ST, MSc.

Tanggal Diberikan Tugas :

Tanggal Diselesaikan Tugas :

Judul Tugas Akhir : SCHEME OF HULL CORRECTIVE MAINTENANCE  
MODULE FOR MANAGEMENT DECISION SUPPORT  
USING MICROSOFT VISUAL BASIC.

Yang menerima tugas,

Dosen Pembimbing I

Dosen Pembimbing II

Mahasiswa

Dr.Ir. Ketut Buda Artana, MSc.

## ABSTRAK

Sistem perawatan korektif untuk lambung kapal harus dilaksanakan seefisien dan seefektif mungkin. Proses pemindahan data dan informasi dari kertas kerja satu ke yang lain menyita banyak waktu dan energi. Dalam pemindahan jumlah data yang besar, kemungkinan terjadinya kesalahan akibat faktor manusia menjadi lebih besar. Ketika pengolahan data untuk pengambilan keputusan menjadi rumit, hal ini perlu sebuah pendekatan yang sistematis untuk manajemen informasinya. Perusahaan pelayaran memerlukan suatu dukungan teknologi informasi yang cepat dat teliti untuk membantu analisa dalam pengambilan keputusan manajerial.

Solusi untuk jaminan kerapian dokumentasi perawatan kapal ialah dengan menggunakan komputerisasi sistem database perawatan lambung. Modul Perawatan Korektif untuk lambung kapal dapat membantu pengumpulan, penyimpanan, pembaharuan, pengolahan data perawatan lambung kapal dan prediksi perawatan. Dalam fungsinya untuk membantu keputusan manajerial, maka modul ini membantu memberikan penilaian kegagalan dari laporan kegagalan untuk menentukan tingkat kegagalan dan status perbaikan; cargo data memberikan informasi mengenai perkiraan pendapatan untuk setiap perjalanan; dan outsource data telah memberi informasi seperti *down time*, perkiraan biaya dan faktor ketersediaan. Itu semua, akan membantu pihak manajemen untuk memilih *outsource* yang terbaik, untuk aktivitas perawatan kapal. Dalam tugas akhir ini, penulis menggunakan *Microsoft Visual Basic* dan *Microsoft SQL Server* untuk membangun sistem database perawatan lambung kapal.

Oleh karena itu dengan implementasi dari perangkat lunak ini, memungkinkan penyimpanan dan pencarian data efisien dibanding dengan menggunakan banyak kertas kerja. Modul ini juga membantu akses data dari beberapa orang yang terlibat dalam perawatan lambung kapal..

**Kata kunci:** *Modul Perawatan Korektif untuk lambung, Database Perawatan, Keputusan Manajerial, Microsoft Visual Basic dan Microsoft SQL Server.*

## **ABSTRACT**

Corrective Maintenance System for hull should be executed efficiently and effectively. Evacuation process of data and information in Fleet Division, from one worksheet to the other will confiscate of time and energy. In transferring amount of data, the human error probability becomes bigger than a few data. When the data processing for decision support was overwhelming, thus necessitating a systematic approach to information management. Shipping company requires an information technology support for quickly and accurately analysis in management decision making.

The solution for neatly maintenance documentation guarantee is using a computerize maintenance database system. The Hull Corrective Maintenance Module assists to corrective maintenance data collection, recording, storing, updating, processing and forecasting. At the function to assist the management decision, this module would give a failure assessment from failure report to determine whether the failure level and repair status; cargo data had given an information concerning the income estimation for every trip; and outsource data had given any information such as down time, cost estimation, and availability factor. That all, will assists the management personnel to choose the best outsource, which use for maintenance activity. In final project activities, the author using Microsoft Visual Basic and Microsoft SQL Server to construct the hull maintenance database system.

Therefore by implementation of this software, perhaps the depository and data seeking more efficient than using a lot of paper sheet. Hull Corrective Maintenance Module also assists the data access from many persons related in hull maintenance connection.

**Keywords:** *Hull Corrective Maintenance Module, Maintenance Database, Management Decision, Microsoft Visual Basic and Microsoft SQL Server.*

## **PREFACE**

All of the honor, praise and glory belong to my Almighty God, for HIS strength, power, mercy, love and all that HE has done unto me until I could finished my final project. Actually, I am nothing without HIM. My final project has the following title:

**SCHEME OF HULL CORRECTIVE MAINTENANCE  
FOR MANAGEMENT DECISION SUPPORT  
USING MICROSOFT VISUAL BASIC**

This final project was arranged as a requirement of Bachelor Degree graduation in Marine Engineering Department, Marine Technology Faculty, Sepuluh Nopember Institute of Technology, Surabaya.

The author has realized this final project is a far way from perfection. Therefore, the author hope is a suggestion and development criticism will be given for this final project. For this opportunity, the author would give thank to every person that involved in finishing my final project.

1. Mr. Dr. Ketut Buda Artana, ST, MSc. as my final project counselor who has given the precious motivation, direction, knowledge and all that I can't mentioned it one by one, unto me for my final project.
2. Mr. R. O. Saut Gurning, ST, MSc. as my final project counselor and college supervisor who has given the precious motivation, direction, knowledge, prayer and all that I can't mentioned it one by one, unto me for my final project.
3. Mr. Ir. Dwi Priyanta, M.SE as a RAMS Subject Coordinator who has given the precious motivation, direction, knowledge and all that I can't mentioned it one by one, unto me for my final project.
4. Mr. Ir. Soerjo Widodo Adji, M.Sc as a head master of Marine Engineering Department, Marine Technology Faculty – Sepuluh Nopember Institute of Technology, Surabaya.

5. Every Marine Engineering Department lecturers who have given the precious direction and knowledge as long as my study time in Marine Engineering Department.
6. Every Marine Engineering Department staffs who have given much of assist as long as my study time in Marine Engineering Department.
7. My beloved Mom and Dad in Madiun City who have given an example how to survive and conquer this life. Thank for your love, passion, attention, education and prayer in every breath that I take.
8. My beloved Brother in memoriam, for your life shared in the past that strengthen me until now.
9. My boarding house friends what have come to my brother friend during this time, given some aids and motivation to the author in Final Project.
10. All of my friends in PMK – ITS (Lidia, Esther, Connie, Beatrice, Harrie, Richard, Ega, Roy and others) for your understanding, passion, motivation, prayer and joyful that have been given unto me.
11. All of my friends in PAW Department (Nandy, Edwin, William and others) for your understanding, motivation, prayer and joyful that have been given unto me.
12. All of my friends in Harvest Satellite (Henry, Laorent, Erna , Marja, Sindhu and others) for your medicine when I was sick, understanding, motivation, prayer and joyful that have been given unto me.
13. All of my friends in Reliability & Safety Laboratory that have given support for me to finish my project work.
14. All of my friends in Marine Engineering Department, especially 2001ers that I can not mention it one by one, for support, spirit and help.
15. Other related person that I can't mention it one by one.

And at the end the author hope that this final project can give benefit, knowledge and information to everyone that read this final project.

Surabaya, January 2006

# **CHAPTER I**

## **INTRODUCTION**

# **CHAPTER I**

## **INTRODUCTION**

### **1.1 Background**

Hull Maintenance System should been executed efficiently and effectively. Therefore, require the existence of adequate operational data system. Information technology support for the operation control data, be needed to make quickly and accurately analysis in management decision making for the shipping company.

The aim of ship maintenance is to assist the shipping company management can fulfilled the conditions of safety policy, environmental protection and regulations from international classification society. Shipping company is obliged to fulfill one of policy from IMO (International Maritime Organization) that is about released the ISM (International Safety Management) Code to take care commitment of management. Because this matter represent the condition to obtain DOC (Documents of Compliance) for the company and SMC (Safety Management Certificate) for the ship. Because of that, every data of maintenance have to be manageable efficiently and effectively for management report.

In actually, data traffics especially in armada division were solid enough. There are too many of manual work in inspection report analysis. Evacuation

process of data and information from one worksheet to the other will confiscate of time and energy. In transferring amount of data the human error probability becomes bigger than a few data.

Usage computerize system in keeping maintenance report, was also felt maximal less used, it is caused by registered in different various program. With insufficient tool, a Fleet Manager will obtain difficulties in determining decision as quickly and precisely for repair status. And existence about tradition of concerning ships maintenance, that only pursuant to decision maker experience (Fleet Manager), so when commutation of Fleet Manager will be happened, processed the experience transfer wouldn't maximal. Therefore, need a good management of change. Every decision taken for ship maintenance not only influences the ship operational, but also has truly impact for the earnings of shipping company.

The solution to guarantee the neat maintenance documentation is using software, which can update the every step from process of ship maintenance with the newest data. Where Hull Maintenance Management is representing an innovative solution for the inspection arrangement and ship repair strategies. The focus from Hull Maintenance Management is integrity of hull life cycle owned to cover the inspection strategies and periodical maintenance. When detailed inspections have been already done, the inspection result required follow up step by shipping company management.

The Fleet Manager needed a tool, which can assist in conducting its duty as a person who has a responsibility in execution monitoring of ships

maintenance. Using Hull Corrective Maintenance Module for Management Decision Support which its function is make some assessment from non conformities report to determine whether the damage represented Minor Work or Major Work requiring furthermore action and finally to determine the repaired status. Processing the scheme development paradigm Management Decision Support Software is a group of duty, phase and efficient activity to transform of user requirement to an effective software solution. In represented the activities that happened during the inspection report assessment uses the Microsoft Visual Basic.

Fleet Portal contains the accurate historical data, the transport route, the result of previous inspection, the method and explanation about the previous maintenance and its material. From this information, is expected to assist analyzing condition the Sister Ships (the ships which seen to be own the looking like of hull form), have the corrosion damages at different place. With the existence of accurate information support from inspection report, a Fleet Manager from will be easier to assess the assorted cause of damage or non-conformities which was founded in field.

The inspection reports will be analyzed to assess the risk so that could take a decision with concerning maintenance precisely. To analyze the non-conformities report use the FMEA method (Failure Modes and Effect Analysis), so that plan to determine the model and the effect from the damages. Pursuant the analysis, a continuation decision from the inspection reports can be made to decide whether ship can continue its operation but with

the existence of periodical inspection, or bring the ship for the docking repair. However the software purchasing expense make expenditure expense will be increase, so that installment factor is competent become the special consideration for shipping company management.

## **1.2 Problem Formulation**

The problem of scheme the Corrective Maintenance Module:

1. How to determine the risk priority number, from an inspection report with this module.
2. How to determine down time period, with historical maintenance data.
3. How to know the relationship between the dock space availability with the repaired status.
4. What is the impact of Corrective Maintenance Module for hull maintenance application, in the making of good management report concerning the reasonable repair.

Problem definition used in solving of this final duty is:

1. Failure report as an input for Failure Assessment.
2. In scheme of Corrective Maintenance Module do not assess the compatible hardware.

### **1.3 Writing Purpose**

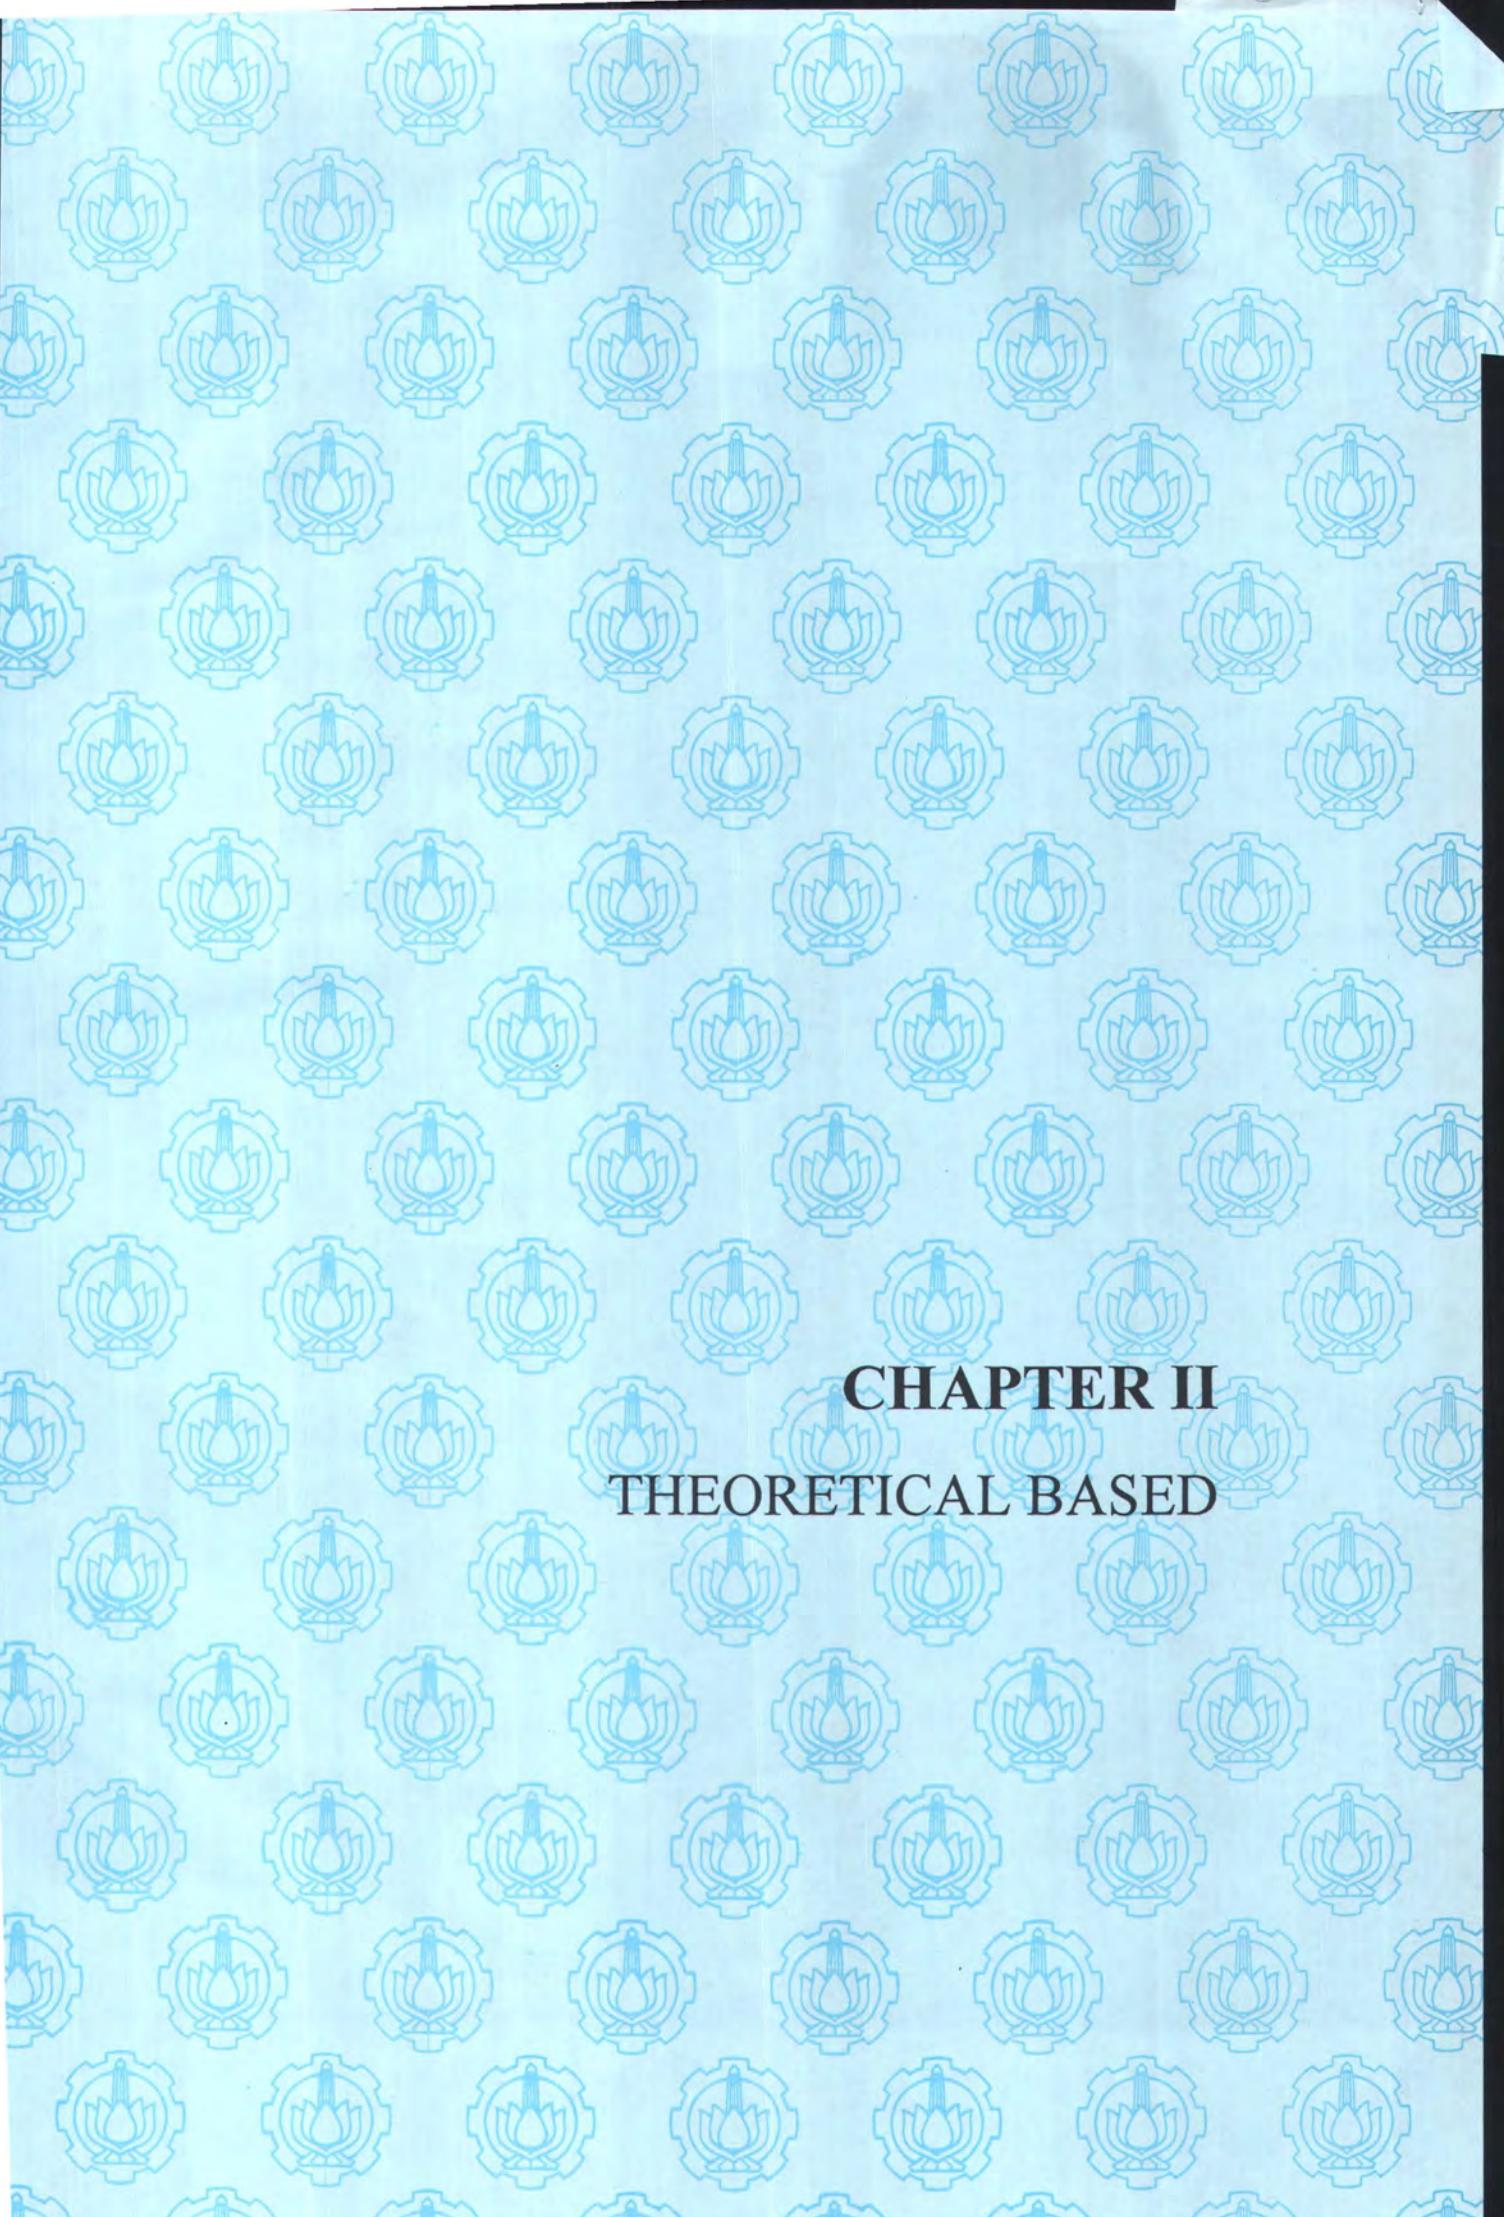

In this final project will take some purpose. Intention of study process to be done for:

1. Knowing the way of software scheme by Microsoft Visual Basic for maritime application.
2. Knowing parameter for the managerial decision making of ship repair status
3. Knowing the way of analyzing, non-conformities inspection reports for hull damages.

### **1.4 The Benefit of Final Project Result**

From result of scheme Corrective Maintenance Module obtained the following benefit:

1. With the existence of software scheme use the Microsoft Visual Basic be expected able to depress the expenditure especially for the expense of purchasing and software installment.
2. Give an input to shipping companies, upon the consideration concerning hull maintenance software.

## **CHAPTER II**

### **THEORETICAL BASED**

# **CHAPTER II**

## **THEORETICAL BASED**

### **2.1 General**

By operating ship, go out to sea to cause the great enough damage potency for hull construction. Work scope to hull cover the body / ship construction / ship husk especially part of below or under load line is inclusive of sea chest. The example damage is: rustiness, gluing of plant and animal go out to sea the, cart, rips the, leakage, deformation, displacement or possible moment of making or repair does not pursuant to going into effect (Sasongko, 1996).

### **2.2 Hull Construction Failure**

Displacement and erosion also result the leakage happening. While because accident factor will enable to the happening of following at husk or construction log or possible also cart. The happening of cart, rip, even leakage to plate of hull construction oblige to change newly as according to guide and classification rule. Dint (dented) and also wave (corrugation) at plate of construction husk can be depicted at Shell Expansion and have to be changed by pursuant to classification (Sasongko, 1996).

According to Sasongko (1996) the happening of rustiness at hull construction will result:

- ♦ Decreasing of hull construction generally

- \* Taking place of rustiness process will result the happening of leakage of plate of husk of ship construction.
- \* Decreasing of it thick seta leakage oblige to change and repair.
- \* This repair cost money which do not minimize also will add the cost allocation for the treatment of ship repair and,
- \* Repair will confiscate the time operate for the ship result the ship earnings will also decrease.

According to Sasongko (1996) inspection at hull construction cover the:

- \* Thick measurement of husk plate and also precisely on course.
- \* Location inspection and also wide measurement and deepness of deformation of plate of construction husk.
- \* Inspection to rustiness condition, paint abraded and leakage routinely

### **2.3 Hull Maintenance Software**

To increase monitor ability for every fleet by inspection optimize, usable hull treatment management hence software of Hull Maintenance. Advantage which can be obtained with the software application for example: existence of accessing to always to know the condition nowadays hull with the election of management report can improve the observation process the inspection and execution of structure treatment become militant from hull of ship. The available of transparent information and easy to understand for management party to overall of armada owned. ([www.dnvsoftware.com](http://www.dnvsoftware.com)).

Software of this Hull Maintenance is designed for the : optimize of the reporting database, analysing hull condition, assisting organization of management function better with the existence of adequate data support and structure govern the job and also the specification of from treatment. This system is consisted of the system at ship and office (liner), what organically database transfer by update database ([www.dnvsoftware.com](http://www.dnvsoftware.com)).

## **2.4 Database Management System**

And Database Management System represent a group of program to define, to making / storing and database manipulation to assorted of application. Its intention Data manipulation looks for the data (query), data modification (update) and makes the report (Pramana, 2000).

While software of Hull Corrective Maintenance for Management Decision Support representing the part of Hull Maintenance Management, has target to be can study the damage reported by an inspection moment to evaluate the status of ship and its continuation action. Risk enumeration require to be taken to be facilitating risk arrangement remember the existence of order - obligatory order this time. Monitoring consistently to be done lessen the fatal impact of function failure ([www.dnvsoftware.com](http://www.dnvsoftware.com)). To get the failure function with the risk study can be taken by using Failure Modes and Effects Analysis (FMEA). Influencing failure can also that moment from installation early hull or repair moment (Keyserling, 2000). By FMEA obtainable analyze the risk quantitatively and also

qualitative which also to get the level of damage risk that happened at the time of inspection (Keyserling, 2000).

In scheme of software of Management Decision Support use the Microsoft Visual Basic applicative for this time, because most job world still use the Microsoft Windows (Holzner, 1998). Basic very easy to write the program base on the Windows. Environmental of Visual Basic programming contain all medium required to develop the program for the Windows of swiftly and efficient. Existence of line of menu and toolbar give the amenity to access to all command controlling this program. ( Halvorson, 2002)

According to Pramana (2000) in designing software there are some activities, covering:

1. Requirements Analysis and specification

Understand will conducted by that moment system (fundamental problems) and express in the form of clear and detail.

2. System And software design

Determining correct solution for the fundamental of above problems and express [it] in an easy form to be translated to a computer program.

3. Implementation / coding

Translating designed by software to a programming language.

4. Testing

Checking software so that as according to requirement wanted and free from the mistake (error / bug).

## 5. Operation And maintenance

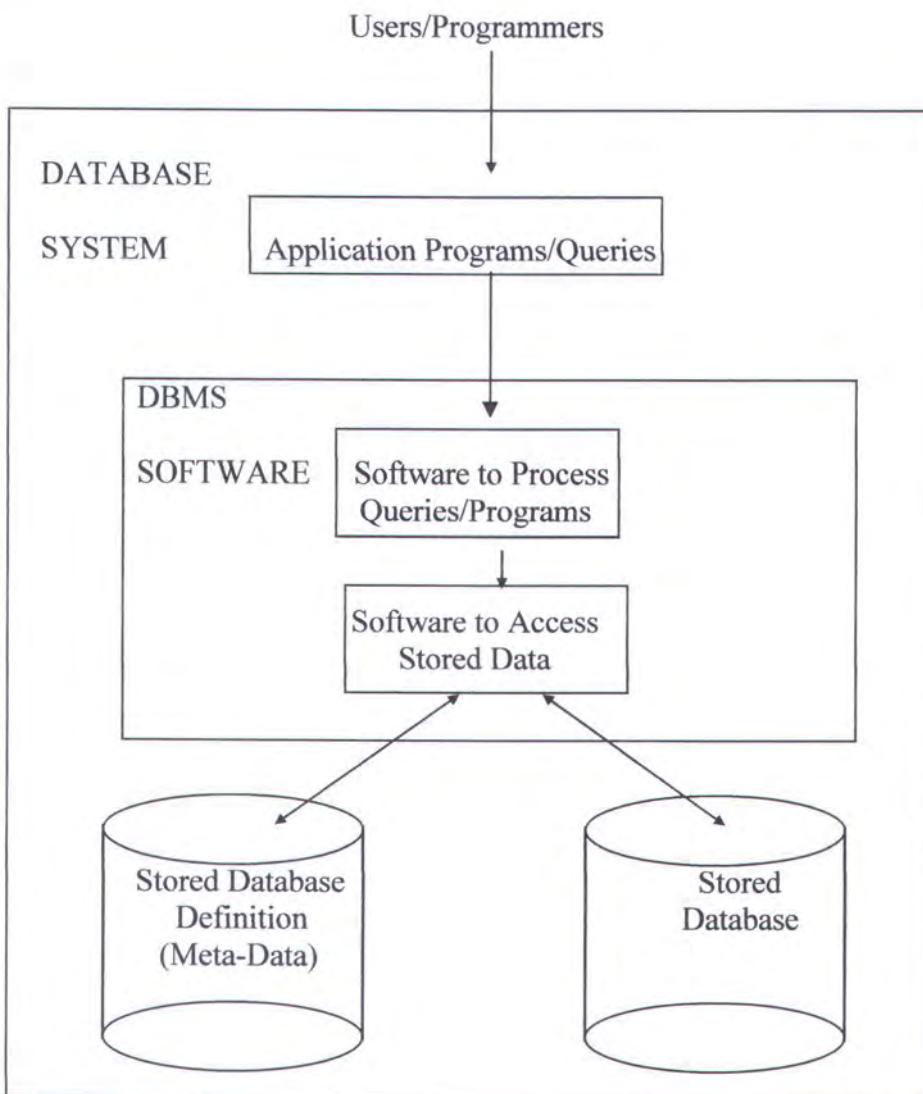

Repairing any mistake [is] which emerge and improve the facility from system as according to requirement

The data model gets its inputs from the planning and analysis stage. Here the modeler, along with analysts, collects information about the requirements of the database by reviewing existing documentation and interviewing end-users.

The data model has two outputs. The first is an entity-relationship diagram, which represents the data structures in a pictorial form. Because the diagram is easily learned, it is valuable tool to communicate the model to the end-user. The second component is a data document. A document that describes in details the data objects, relationships, and rules required by the database. The dictionary provides the detail required by the database developer to construct the physical database. Database design is defined as: "design the logical and physical structure of one or more databases to accommodate the information needs of the users in an organization for a defined set of applications".

## Database System

A database system is compilation between database and software for manipulate database.

*Picture 2.1 Simplify Database System Environment.*

The design process roughly follows five steps:

1. Planning and analysis
2. Conceptual design
3. Logical design

#### 4. Physical design

#### 5. Implementation

The data model is one part of the conceptual design process. The other, typically is the functional model. The data model focuses on what data should be stored in the database while the functional model deals with how the data is processed. To put this in the context of the relational database, the data model is used to design the relational tables. The functional model is used to design the queries which will access and perform operations on those tables.

## **2.5 Entity Relationship Modeling**

Modeling Data / Data Analysis is technique to comprehend a problems and its complexity as well as to get the information required to solve problem the by seeing the problems from the aspect of look into the DATA

Some technique of modeling data:

#### 1. Entity Relationship Modeling

Is first time introduced by Chen P. (1976). Most Model data often used in design of database application conceptually, with the focus of data which will be kept.

#### 2. Semantic of Modeling Object

Using concept of class and subclass in modeling data

#### 3. The NIAM ( Nijssen Information Analysis Method)

Model this pursuant to description data truthfully. This is conceptual data model owning complete notation for the represented of data.

#### 4. Binary of Modeling Data

Is a data model to orient the graph, where its dots (nodes) is an attribute atomic (simple) and its lines (binary arcs) represented relationship type between two attribute

#### 5. Object-Oriented Modeling

Technique modeling which is pursuant to concept orienting at object (object-oriented) and suited for application using language and database orienting at object.

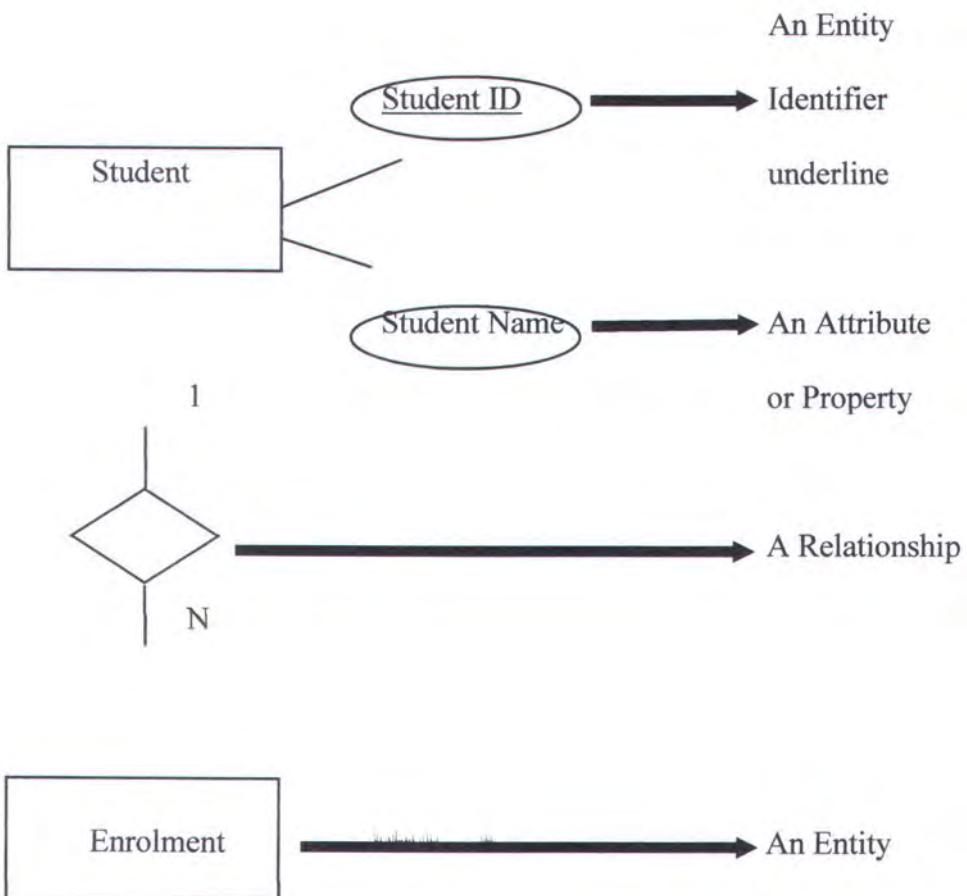

From all kinds of the data modeling technique, ER Modeling is the most popular during last 2 decades, though latterly start to emerge the other, which can represented of more amount information that is Semantic of Object of Modeling and Object-Oriented Modeling.

What there is ordinary system represented in the form of element (entity) from problems, its characteristic (attribute) and relation/link (relationship) usher the elements.

### **Phase E.R. Modelling**

1. Learning input
2. Design the conceptual model in mind
3. Representation Model by using diagram which hence notation of ER modeling.

## Notation

*Picture 2.2: Main component in ER Modeling.*

## Entity

Complex Entity enough to be defined so that cannot be got by an acceptable and satisfying definition by all party. In general, entity is something in the world of reality owning separate existence. A entity can in the form of an object owning physical existence (human being, car, house, or officer), or in the form of an object owning conceptual existence (company, work or majors from an university)

Follow the example of the entity:

- \* student, lecturer, class, study area (in university modeling)
- \* officer, manager, departmental (in white collars modeling)

Entity Instances:

- \* Kindness is instance from entity student
- \* S1 Sistem Perkapalan is instance from entity of study area

Weak Entity is entity, which its existence hinges full at existence from other entity. For example, husband / wife from officer are weak entity which its existence base on the entity officer.

### Attribute

Attribute is property from entity in the form of information about the entity. For example, entity officer own the following attribute:

- \* Name
- \* Address
- \* Gender
- \* NIP (Number of Officer Mains)

Follow the example of the attribute above is ordinary attribute. Others, there are some other type attribute, that is Composite Attribute, that is attribute which is formed by merger of some other attributes. For example: attribute address, coming from merger attribute walked the, town and zip code.

Multi-value Attribute, that is attribute owning some value (nilai) to every instance from entity. For example: title (Ir, drs, SH ...), somebody can own

some title at one blow

Identifier (key) special attribute which by unique can be used to identify a

An instance from entity. For example:

- ♦ NIP [is] key for the entity of officer
- ♦ NRP [is] key for the entity of student

### **Relationship**

Relationship used to connect two entity or more with the certain meaning.

For example incoming Kindness Student [of] majors of area of study of S1 Sistem Perkapalan Officer Tono put hand to the company X Degree (derajat) from relationship is amount entity participating in the relationship. This Degree can in the form of unary (one entity), binary (two entities, three entities) ... Relationship Binary, which is most commonly, used the Cardinality from relationship used to identify the structure from relationship. For example:

- ♦ One To one ( 1:1)
- ♦ One To many ( 1:N)
- ♦ Many To many ( N:M)

### **Advantage of ER Modeling**

1. Simple
2. Able to represented core from what required making a good design database.

## Loss of ER Modeling

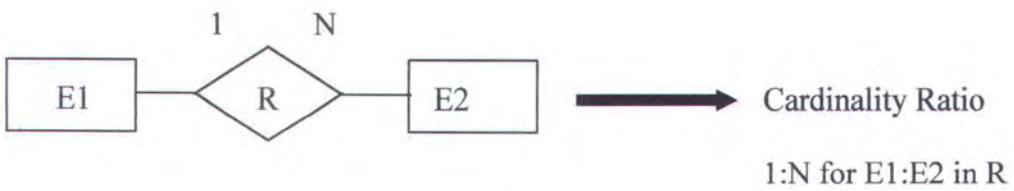

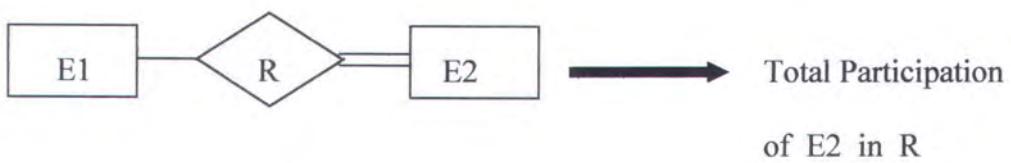

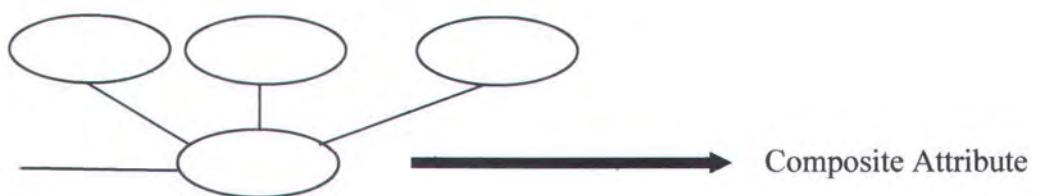

1. Its result can in the form of some alternative model, depended how all analyst / designer comprehend the system.
2. Notation from ER modeling still a lot of variation (less standard).

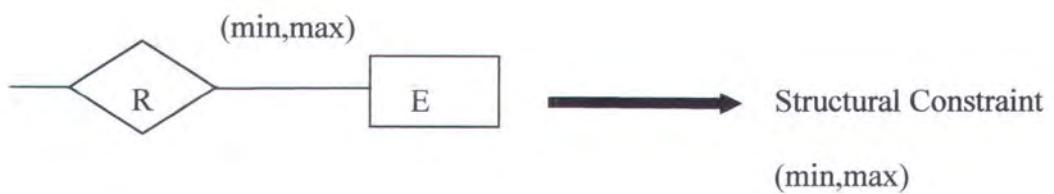

## Summary ER Modelling Notation

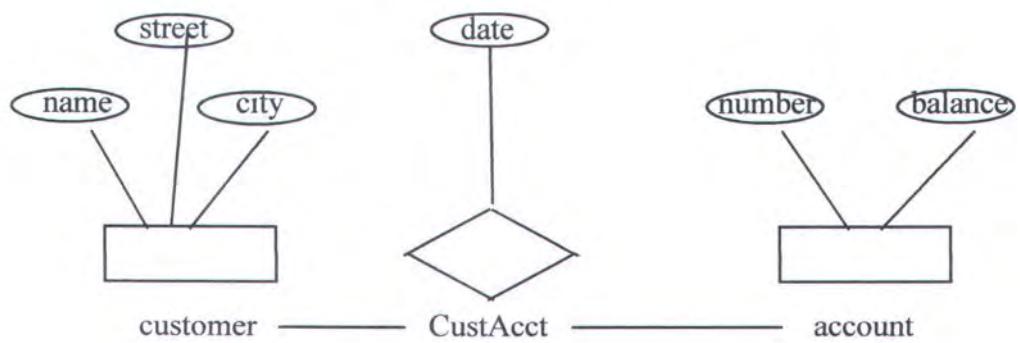

.....

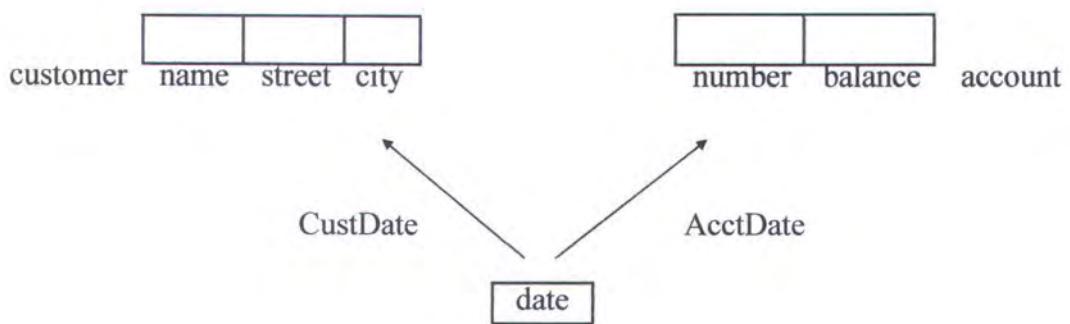

*Picture 2.3 Summary ER Modeling Notation*

ER diagram:

Data-structure diagram:

*Picture 2.4 Example of ER Modeling*

## **2.6 Microsoft Visual Basic 6.0**

Visual Basic is one of computer language programming. Language programming is a command that understood by the computer to do certain duties. Visual Basic language programming that developed by Microsoft since year 1991, representing development from its predecessor that is BASIC (Beginners All-Purpose Symbolic Instruction Code) language programming that developed at 1950. Visual Basic is one kind of Development Tool that used to make assorted of computer program, especially a computer program that used Windows operating system. Visual Basic represent a language programming that supporting object (Object Oriented Programming = OOP). In object Oriented Programming (OOP). Window Form of Visual Basic has the character of the UI (User Interface), which we can develop by using a peripheral control of toolbox.

Program that based on Windows have the character of event-driven, it's mean program that work based to the event that happened to the object in the program. For example, if a user clicking a knob hence program will give the "reaction" to the event click. The "reaction" that gives by Program will match according to the code program (algorithm) that made for event at certain object. Algorithm from this program will we develop according to ER diagram which we have made previously, and the table form will we make as easy as possible for the user that will used this program later.

## **2.7 Computerize Maintenance Management System (CMMS)**

The objective of maintenance organization is to maximize uptime in most cost effective manner. To accomplish this objective, the following strategies must be clearly specified:

1. Effective maintenance strategies derived from equipment condition and history.
2. Effective techniques for planning and scheduling of work order and utilization of resources.
3. Monitoring of maintenance activities, data collection and performance reporting to support continuous improvement.

These three activities require information about equipment, worker, work orders, jobs, job standards, production schedule and the nature of operations organization. The amount of information that is collected processed and use for decision making is overwhelming, thus necessitating a systematic approach to information management. In, addition, the complexity and uncertainties involved the process of maintenance, engineering and the amount of information handled in a typical maintenance system require computer support. Appropriate computer support provides the means for quick and timely response.

A computerized maintenance management system (CMMS) is basically an information system adapted to serve maintenance. A CMMS aids in process of data collection, recording, storing, updating, processing, communicating and forecasting. The CMMS is an integrated system that helps the maintenance

leadership manages all aspect of life in the department. It is essential for planning, scheduling and controlling the maintenance activities. Through effective reporting, a CMMS can provide maintenance managers and engineers with the information needed for sound decision making to control and improve the maintenance process.

Most organization today has some sort of computerized maintenance support but may have failed the reap the full benefits of CMMS for the following reason:

1. In many cases, the system doesn't meet the maintenance requirements.
2. The system not user friendly.
3. Maintenance planners and engineers are well not trained in using CMMS.
4. CMMS reports are not used for maintenance improvement.

The success of a CMMS can be measured by its availability to support the maintenance process. Two important elements are essential for an effective CMMS:

- Its ability to support the main activities in the maintenance process and,
- The ability the software and hardware configuration of terms of its reliability ease of use, quality of information and timely processing.

CMMS can be centralized in small organizations or completely decentralized and distributed in large organization. It can run on main frame, micro computers, workstations and personal computers. In addition, it can be a standalone system or part of a network in a client – server environment. A typical local area network may have several remotely located terminals. The

software can be menu driven or window based. A typical CMMS is linked to inventory, payroll, purchasing and accounting. Experience has shown that the system reliability, timeliness and ease of use enhance the utilization of a CMMS and increase its benefits to the organization.

In terms of support to the maintenance process a CMMS usually includes the following functions:

- \* Equipment identification
- \* Preventive maintenance
- \* Work order management
- \* Planning and scheduling
- \* Inventory control
- \* Job standards
- \* Equipment history
- \* Costs and budgets
- \* Performance reports
- \* Quality reports

In the design process of a CMMS one or more of preceding functions are usually grouped into one module. A CMMS design that supports the previous function is presented, for the example this is work order or request control module serve the following functions:

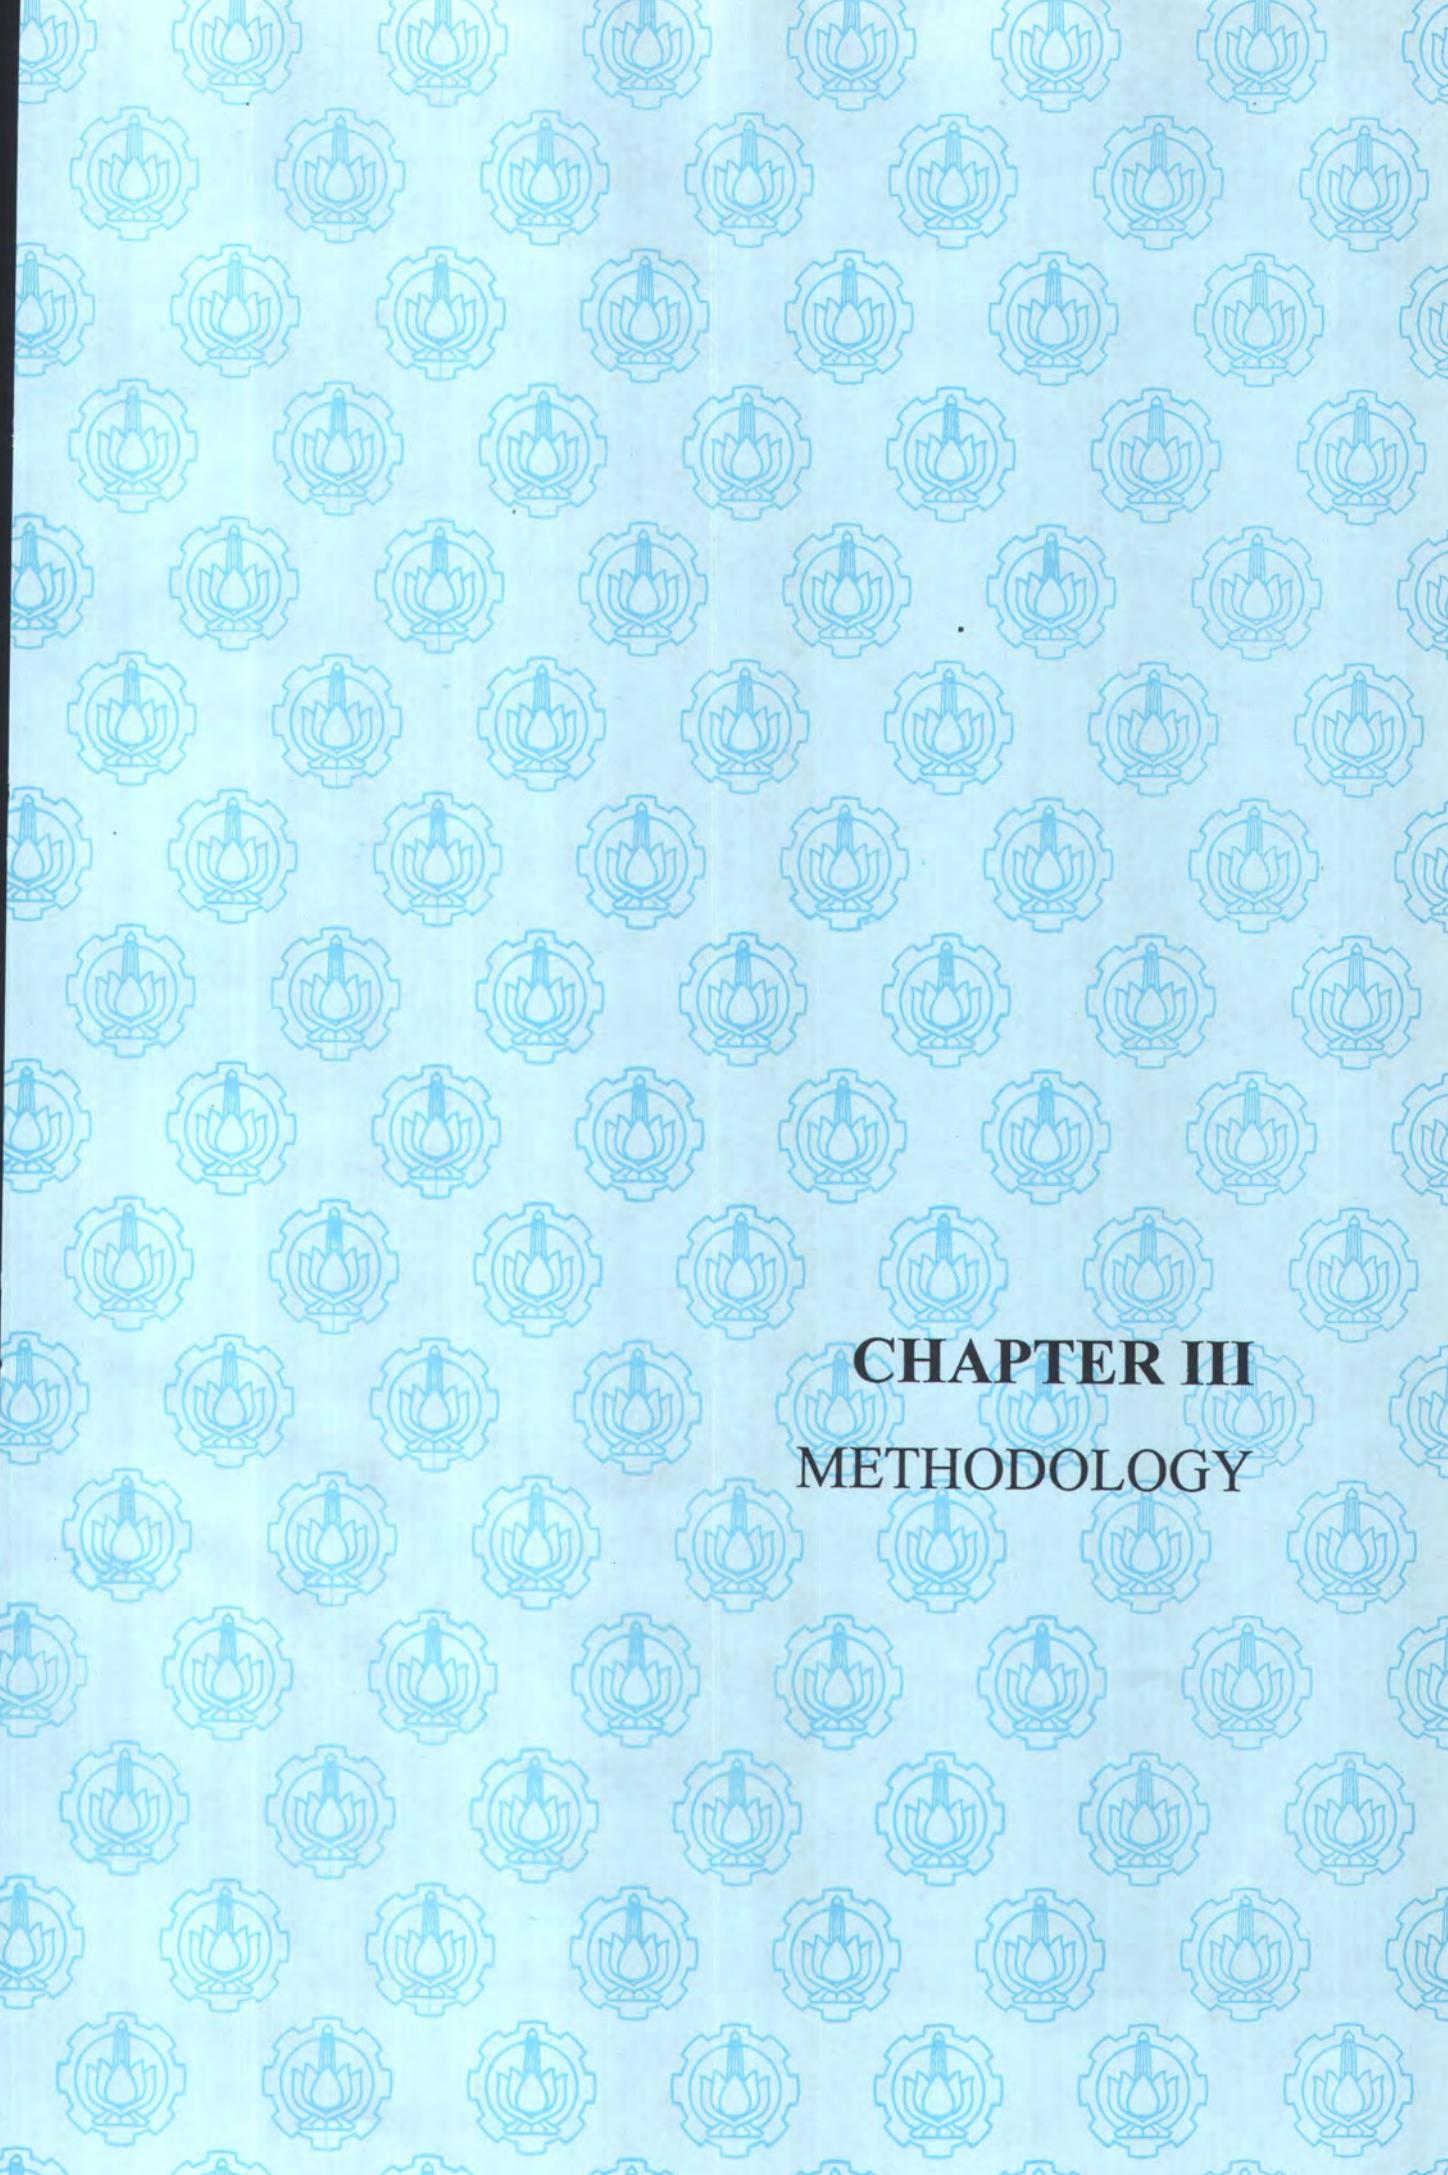

1. Documenting the process of work request and authorizing the work to be performed.
2. Planning, monitoring and controlling the actual work.

3. Collecting data about maintenance performance and costs.
4. Providing needed information for feedback and continuous improvements.

The work order requires two types of information. The first type is used for planning and scheduling and the second is for identification.

This module initializes the work order by supplying the necessary information regarding new jobs. The categories of information are as follows:

- \* Work order number
- \* Date
- \* Problem definition and tool needed
- \* Equipment number, work plan and location.
- \* Estimated man-hours and costs.
- \* Worker and Material

## **CHAPTER III**

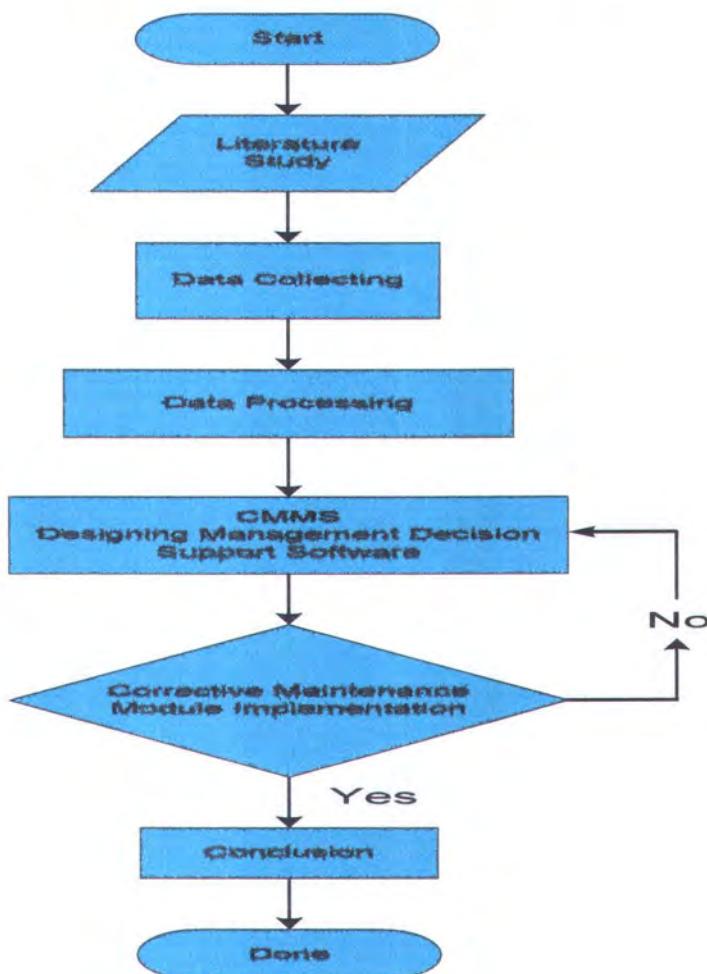

### **METHODOLOGY**

# CHAPTER III

## METHODOLOGY

### 3.1 General

To solve the problems of this final project that have been analyzed, Methodologies represent a base framework that used as a reference. To finish this final project hence will be used a simulation method, so that all data changes can be documented better and clearer picture to analysis from the data than manual work. Step from this method shall be revealed as follows:

Picture 3.1 Methodology of the research flow chart

The explanation from flowchart above as follows:

### **3.2 Study of Literature**

At this phase will be complete to literature, which there have with reference to maintenance ship (maintenance management process), method study the damage modes and effects (with FMEA) also technique study to design software by using Microsoft Visual Basic.

### **3.3 Data Collecting**

Data collecting is a first step to learning about actually condition happen in real fields, so we must build a bridge to take a connection between actually condition and maintenance theories. The most important knows about maintenance of ship activities in Meratus Shipping Company. Data that we need in Software Process Development Paradigm, to develop Management Decision Support for the example as follows:

Business Process of Maintenance activities, Consideration to determine the repair ship status, Shipping Routes, Cargo data, Historical of repair and ship inspection data, Non Conformities Form, Planned Maintenance System record and others.

The method for data collecting from the Fleet Division of Meratus Shipping Company is:

1. Making conversation with the Meratus employees, who involved in Maintenance activities.

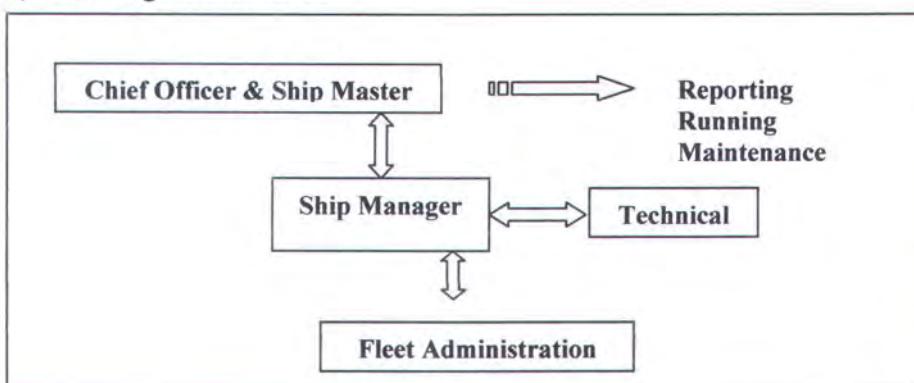

2. Taking some document and example data record from Meratus Shipping Company.

### 3.4 Data Processing

Data obtained learned, and then grouped and compiled such as those, which planned facilitate the input determination, location, process the program and output. Especially is determining the business process of maintenance activities in Meratus Shipping Company as a fixed form.

Business Process of Maintenance activities at Meratus Shipping Company, for the example as follows:

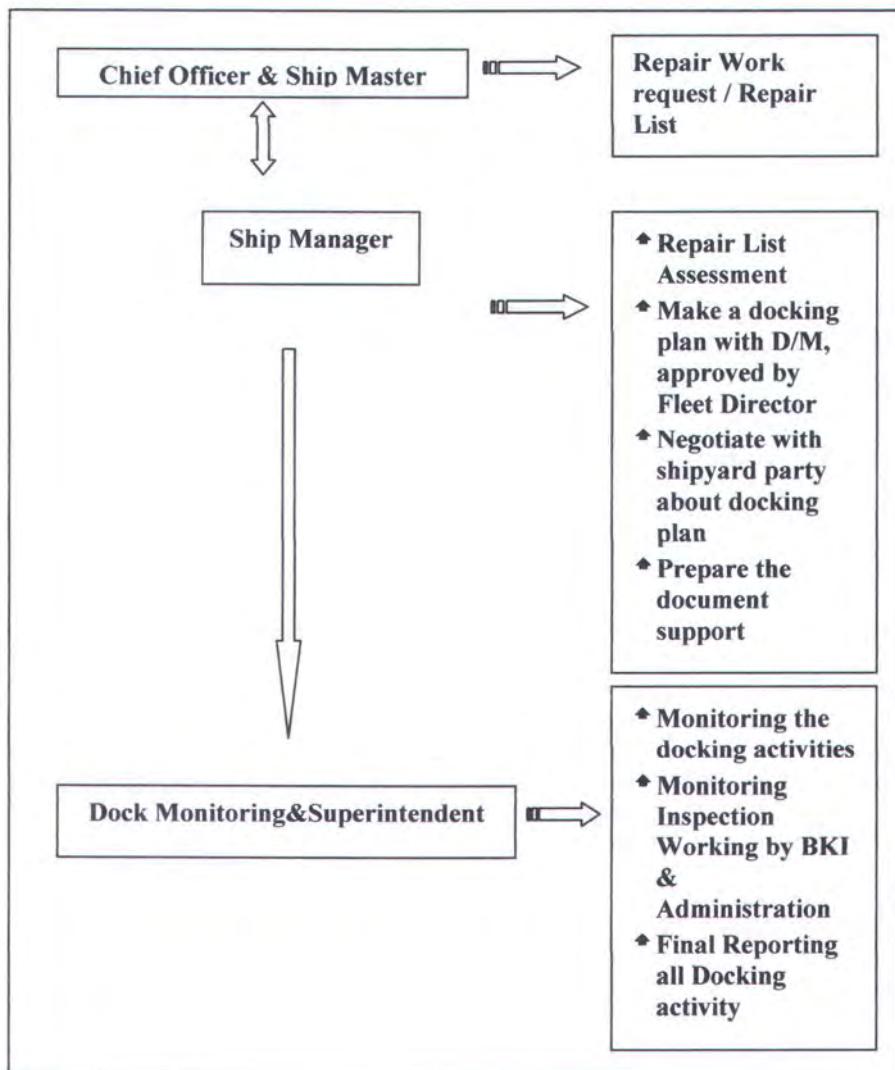

- a) Running Maintenance

*Picture 3.2 Running Maintenance Workflow*

Running maintenance is a maintenance activity according to Planned Maintenance Schedule. Routinely crew activity, which Chief Officer has a responsibilities to record every activity.

b) Docking Repair

Picture 3.3 Docking Repair Workflow

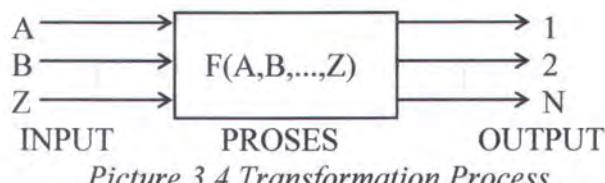

### 3.5 Hull Corrective Maintenance Module Designing

1. Important have requirements analysis and specification, because with understand what thing be done by that moment system (problems fundamental) and express it into clear and detail form.

Systems analysis is some steps, which must be done in order to

identifying, understanding and planning to solve a problem, and at the same time, out for allocation some of planned solution in the software forms. Making specification from a problem (problem specification) usually complicated enough, because used public software system to increase a work system, where previously there is no system at all (or there is, but very finite). It is usually, difficult for an organization to anticipate the effect of change.

System modeling is an art to interpret and get the relevant detail from problems fundamental. One of way of to make the model from a problem is with focusing at staying process in the system. Process is a transformation (change), transaction or event owning certain input and yield the certain output by way of processing the input

*Picture 3.4 Transformation Process*

## 2. System and software design

Determining correct solution for the fundamental of above problems and express, it in an easy form is translated to a computer program. Process designed is representing the continuation from systems analysis process. Design is early stage from development phase of a product or system. Design stage can be defined as:

Applying process of various technique and principal to define a device, detail process or system so that can be realized in physical.

Intention of designer is to yield the model or representation from an entity to be developed later. Then processes from the model development represent result of combination from intuition and experience from designer, which have developed the similar system.

There are two public questions about process designed by this:

- ◆ How to evaluate a designed by a system?
- ◆ How to control a process designed?

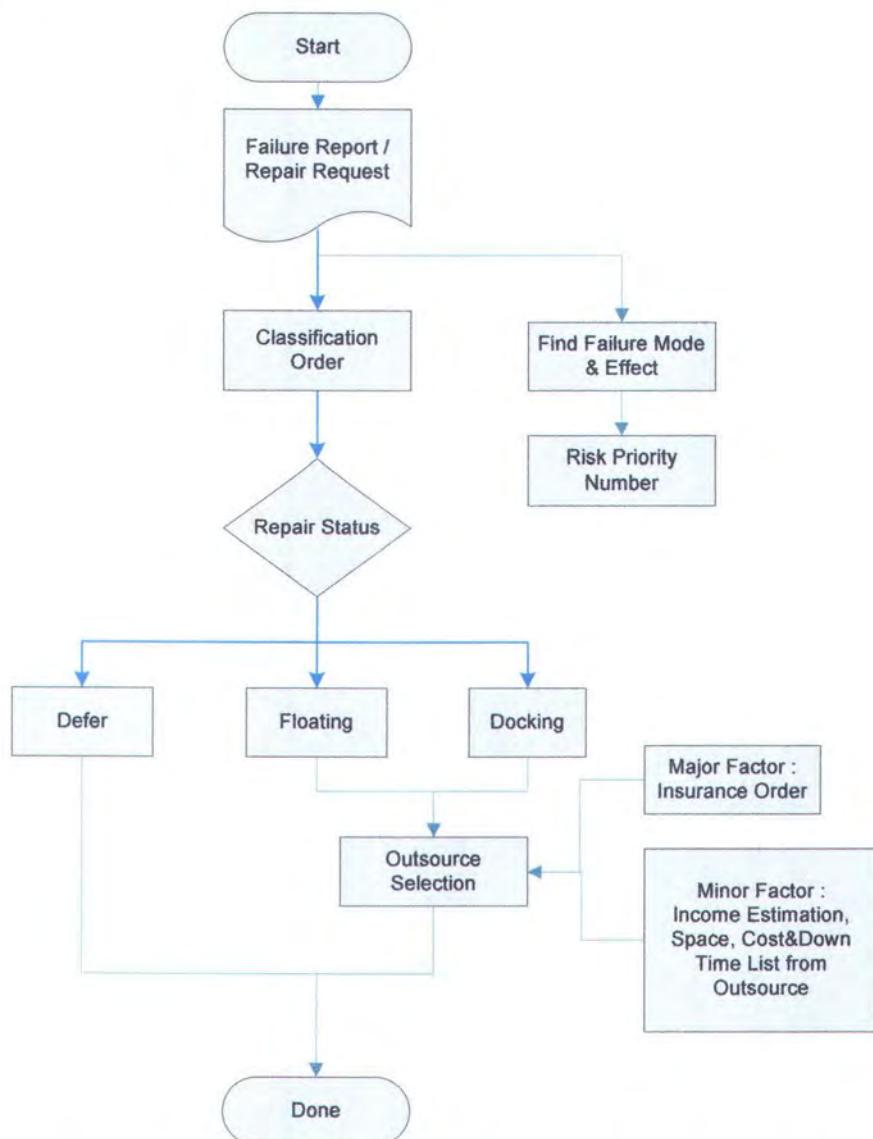

In this phase, quality from data structure, the architecture program, interface and detail from procedure/function developed and repaired continuously, analysed and documented. Design stage yields a software representation, which can be used to assess the quality from software. Principles designed of this, are used by all software engineer during the process designed to take place the concepts designed to provide the criterion basis for assess the quality from designed

Modularity in program and also data and abstract concept enable all designer to moderate and return the reuse of software component.

Program and data structure are especial component from software architecture, while detail procedure prepare for the algorithm implementation. Information Hiding and functional independence provide the heuristics to reach the effective modularity. Software designed process must be done carefully, may not in a hurry. Quality of the result from software very depended from this design stage.

### 3.6 Mechanism Process of Decision Making

The mechanism process of decision making to determine the repair status for the ship constructively software of Hull Corrective Maintenance for Management Decision Support is like flowchart as follows:

Picture 3.5 Mechanism Process of Decision Making Flowchart

Explanation from flowchart above shall be as follows:

### 1. Failure Report

Failure report from visual inspection result represents the input to be analyzed to determine the continuation action. Chief Officer has responsibilities to record every maintenance activities including failure report from visual inspection by vessel crew. Therefore, every failure report should be reported to Fleet Division to get the continuous action.

### 2. Failure Mode & Effect

Important to find the failure mode & effect, because we can estimate every risk from every failures happened. With FMEA method, we obtain the severity, occurrence and risk priority number. In addition, the aim is making documentation the failure, which can be consideration for maintenance system in the future.

### 3. Classification Order

Classification must check the failure and have the right to give some advises or orders about the repair execution. The order concerning about marine safety requirement. Classification has a related connection with the ship certificate, so the obligation of shipping company is fulfill every order from classification.

#### 4. Repair Status

Constitute the beginning step before ship manager or superintendent order the repair execution. The repair status depend on classification order, absolutely its have a directly connection with the hull failure condition. The repair status will be dividing in three terms: Docking repair, Floating repair and Defer or delay.

#### 5. Insurance Order

Every vessel in shipping company had an insurance agreement with insurance company, to guarantee every operational duty. Concerning about repair activity, usually every insurance company will make reference to the certain dockyard become its belief. And shipping company has a right to choose every dockyard which it only has been chosen by insurance company.

#### 6. Income Estimation, Space, Cost & Down time List from Outsource

This income estimation comes from earnings to the transportation of container from each Port. Such space here is the availability dock space of exist in dockyard to conduct the repair activity. The Cost & Down time list from Outsource will be received by shipping company after they offered the repair order to outsource party.

#### 7. Outsource Selection

To choose the best outsource must consider the insurance order as a major factor. The repair cost will be paid by insurance company

according to the polish assurance, if only the hull failure including in insurance agreement. As a minor factor, the income estimation is worthy to get attention, because after choose any repair place from insurance reference, the shipping company wouldn't sacrifice the hug income to choose the repair place. Also with the cost & down time work that be offered by subcontractor & dockyard, availability space for the vessel must support the repair execution. That being compared with the other outsource repair list, to obtain the minimum cost & down time. All of repair execution plan, especially involving the outsource party (dockyard & subcontractor), should been approved by Fleet Director such as his responsibilities in Fleet Division.

### **3.7 Software Implementation**

Implementation or coding phase is translation process from design stage to Programming Language. Coding is often considered to be focus from system development phase, where ought to exactly only some of minimizing from overall of phase.

Reliability in program can be reached by avoiding fault and apply the conducive facility fault-tolerance of operational system remain to though happened the fault which can result the system failure. Some programming technique like command GOTO, pointer and floating-point very easy result

the error. The technique above as possible avoided the use of Facility of data type for the modeling of ‘real world’ very assistive avoid the software faults, because program will be more easy to be comprehended and information will be more be covert. Error in programming will be more seldom is happened. Software can be referred as fault-tolerant if the software still able to be executed though there are fault, which can result the system failure. There are four aspects from program fault-tolerance, that is failure detection, damage assessment, fault recovery and fault repair.

Testing is process execute a program as a mean to find the error. Testing be used to check whether/what result from program developed have as according to result expected

What good technique testing for?

- ♦ Test the good case is test case owning big possibility to find the mistake which not yet been known.
- ♦ The testing can give the information such as which mentioned above.

What referred with the successful test?

- ♦ Successful testing is testing which can find the previous error unknown.
- ♦ Testing cannot indicate that a program free from the error, but only can show the existence error in a program.

Software testing represents one of profession discipline to justify the result product. Becoming the intention of the existence of this testing is finding the

existence of Bug / Error, where software do not work such as those which expected. Finding Bug early possible to anticipate the finding Bug here in after. The finding of a Bug represent the indication of is existence of other Bug. Ascertaining every mistake that happened has been repaired the method used for testing:

- ◆ Dynamic Black-Box Testing to test the data process.
- ◆ Dynamic White-Box Testing to correct Bug.

### **3.8 Frame the Conclusion**

Moreover, with this phase the conclusion is made, of course about the assessment this software and the opportunity to develop this software in other time. Absolutely, the final project result (software implementation) need to have discusses with related Shipping Company. It's important, because the suggestion from Shipping Company will become an especially requirement to construct this software in the future.

## **CHAPTER IV**

### **SCHEME OF SOFTWARE**

# **CHAPTER IV**

## **SCHEME OF SOFTWARE**

### **4.1 General**

Process the software development (Software Process / Development Paradigm) is a group of phase, duty and activity required to by efficient transform of user requirement to an effective software solution. The aim Software Process Modeling is to represent of the activity that happened during software making and its changes (evolution). The models use background is requirement to yield a real correct system early possible in its development process. Especial reason is expensive. Progressively early a mistake can be detected in system development, repair expense it progressively lower.

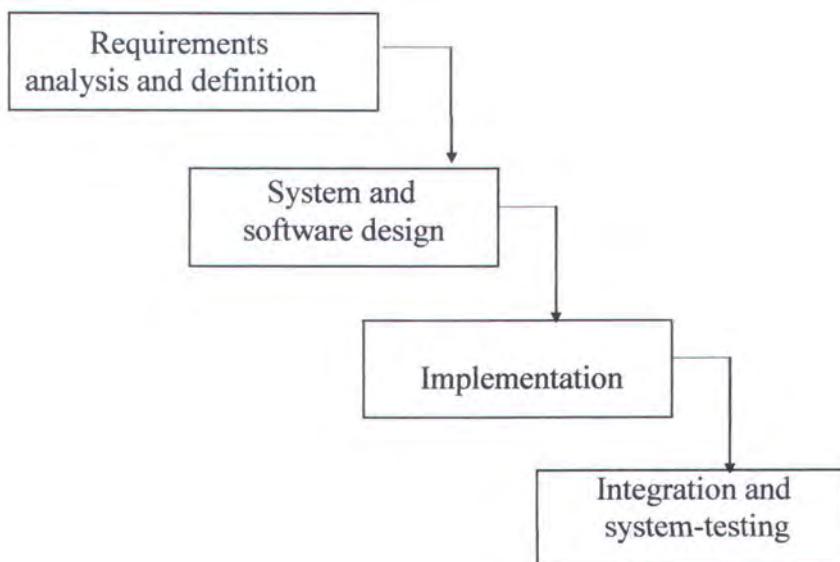

A good process model and structure of determining phase sequence in a creating transition criterion process to go forward to phase hereinafter. Requirement and characteristic from software system from application type differ highly varied, so that there is no a model process or paradigm which can include, or cover all type of system development software.

## 4. 2 Model of Software Scheme

### Model the Waterfall

Model this Waterfall is also recognized by the name classic model.

Because this is a model which is at most recognized and used.

*Figure 4.1: Model waterfall*

The advantage of this structure is every phase own the method to yield a document which can be delivered to user and document yielded every phase can get the specification clearly and detail

First, when we concern to requirement analysis and definition, object of this project should be specified. In this final project we used the Meratus Shipping Company Ltd. as a model object. Therefore, require the existence of adequate operational data system. Information technology support for the operation control data, be needed to make quickly and accurately analysis in management decision making for the shipping company. As representing one

of company which big sharing in business in the world of Indonesia maritime, with the professional worker, making Meratus as liner which have mount the natty and good company management, so that can be made by one of example for the liner of other specially in Surabaya and East Indonesia Area.

This company mount non-stopped till in 1987 having 11 ships and 1990 mounting again become 15 ships. Meratus representing first Indonesia Company serving special is transportation of interfiled container in Indonesia. Nowadays this Company have 29 ship counted in 2005. But unfortunately, Matos didn't have hull maintenance computerize database system. The computerize database system is helpful for maintenance data arrangement.

### **4.3 The Scope of Hull Maintenance System**

Hull maintenance system can be dividing into some maintenance area. We should define the maintenance area of Meratus Shipping Company, especially in Fleet Division.

The Maintenance Area of Meratus Shipping Company is:

1. Planning and Scheduling

The Schedule of Planned Maintenance System being determine by a team work (Ship Manager, Superintendent & Dock Monitoring).

2. Preventive Maintenance

Maintenance working for prevents the failure function with preventive maintenance planned

### 3. Corrective Maintenance

Be determined in 2 conditions, between planned and unplanned maintenance. The aim is to repair and improve a facility condition until fulfill the requirement condition.

### 4. Emergency Maintenance

Can be included to the unplanned maintenance because the repair action must do as soon as possible.

### 5. Continuous Improvement

An improvement phase to analyze all maintenance reporting. The aim is making a decision for the fleet division concerning maintenance system more efficient and effective.

## 4.4 The Business Process of Corrective Maintenance

In the beginning, we must know the workflow of maintenance information from Meratus Shipping Company, especially in Fleet Division:

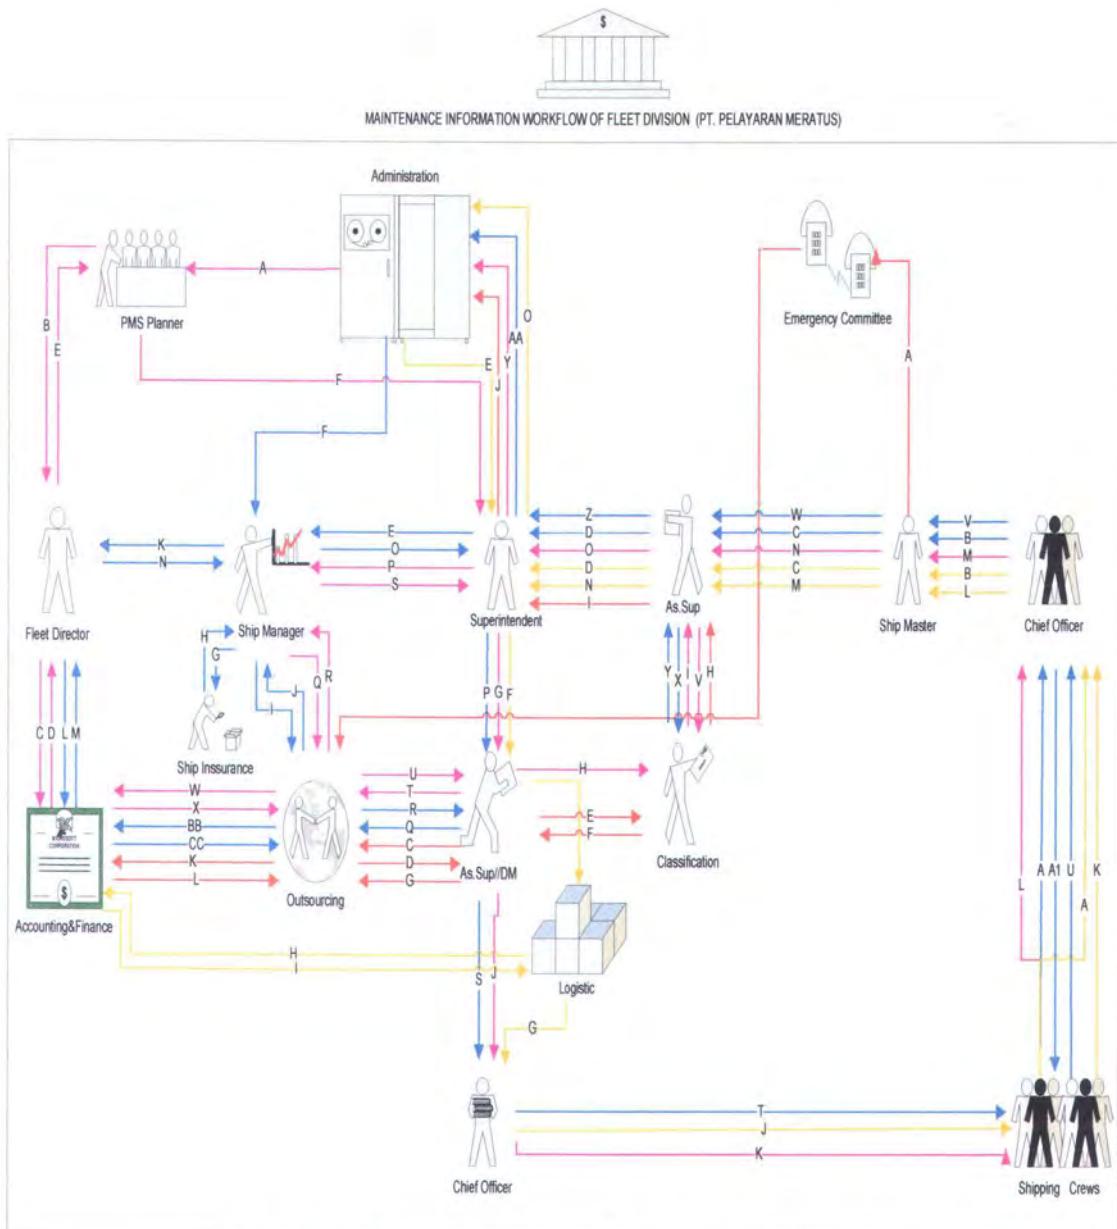

Figure 4.2: Maintenance Information Workflow

For the example, the repair and material request workflow will be explained below:

**1. Repair request**

- A. The crew make the repairing proposal to the *Chief Officer*
- B. *Chief Officer* make a report of repairing proposal with fulfil the minutes on the failure reports
- C. The report of repairing proposal which have been agreed by *Ship Master* will be delivered to the *Assistant Superintendent*
- D. The report of repairing proposal will be delivered to the superintendent that commissioned to monitor the ship maintenance activity
- E. *Superintendent* deliver the report of repairing proposal to the Ship Manager to be analyzed of its repairing status
- F. Ship manager require the data input from the fleet administration to analyze the ship repairing status
- G. Ship manager will check the agreement data with the insurance company
- H. The insurance company will give the agreement data by Meratus officer
- I. When the occurring damage will influence the agreement with the insurance company and need the outsourcing company. Hence, the ship manager will contact the outsourcing company in the agreement
- J. The outsourcing company will offer the repairing plan to the ship manager
- K. The offering result from outsourcing company must get an agreement from the head of Armada Division

- L. Head of Armada Division ask the report from accounting and finance division for allocated budged that planned for overall ship maintenance
- M. The detail report of ship maintenance from accounting and finance division
- N. Repairing plan that have agreed head of division will be delivered to the ship manager
- O. Repairing plan that have agreed by ship manager will be delivered to the superintendent
- P. Repairing plan that have agreed by the superintendent will be delivered by assistance of superintendent
- Q. *Assistant Superintendent* makes coordination with outsourcing company.  
Conduct the observation and control to all docking activity based on dock plan to fulfill the goals in its specified time schedule
- R. Check all activity that conducted by Shipyard Company or contractor on the satisfaction notes. Monitor the docking report as following :
  - i. Docking report
  - ii. Drawing of skin opened and result of ultrasonic test
  - iii. Report of clearance measure and magnaflux test
  - iv. Report of anchor and chain measuring
  - v. Satisfaction notes
  - vi. Certificate and survey report from classification society
  - vii. Painting report :

1. Report of intern docking (ship manager, ship crew, or company's labor)
    - a. report of docking work activity
    - b. report of spare part changing of machine and electricity
    - c. report of using material or construction material
    - d. report of overhaul
    - e. report of merger test result
  2. Help of conducting of final negotiation (include price) with shipyard company
- S. When repairing task possible to conduct by the crew, so the repairing plan delivered to the *Ship Master*
- T. *Ship Master* deliver the Repairing Plan to the *Chief Officer* (head of machine room) to be conducted by the crew. The information transfer from *Chief Officer* to the crew can be a verbal or written command
- U. The crew inform the repairing execution
- V. *Chief Officer* send a report about the failure repairing execution to the *Ship Master*
- W. *Ship Master* deliver the repairing report to the Ass Superintendent
- X. *Assistant Superintendent* ask to classification society to check the result of repairing failure
- Y. The classification society give the repairing check report to the *Assistant Superintendent*

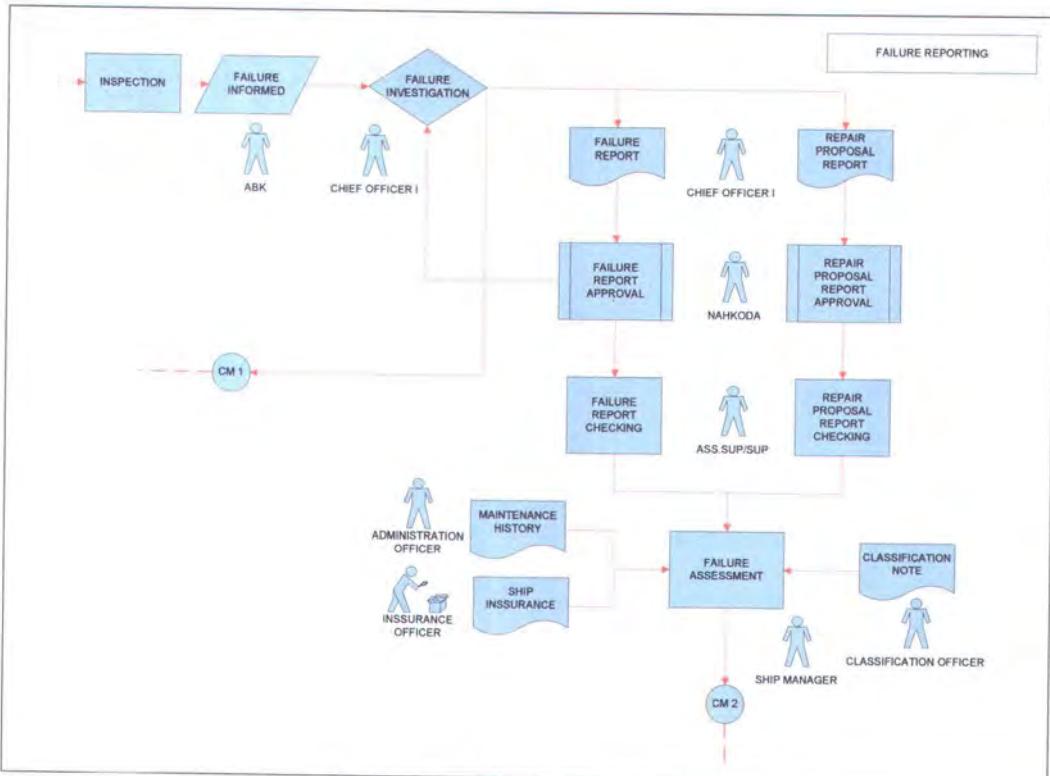

- Z. Having taken steps of Inspection to the report or letter of repairing report hence the report will be delivered to *Superintendent*
- AA. As soon as the repairing report have been checked by superintendent, repairing have been finished and its report enclosed by Fleet Administration
- BB. Outsourcing company give a payment invoice to the accounting and finance division of PT Meratus
- CC. Payment from PT Meratus to Outsourcing

## ***2. Material request***

- A. The crew make the material requisition proposal to *Chief Officer*
- B. *Chief Officer* fill the form of material requisition evidence
- C. Having get the signature from *Ship Master*, the form will be delivered to *Assistant Superintendent*
- D. *Assistant Superintendent* deliver the form of material requisition to Superintendent to be analyzed about its eligibility
- E. Superintendent get the data of ship maintenance record, material supply and material availability on the logistic division from the fleet administration
- F. Things agreed by superintendent in the form of material requisition will be given *Assistant Superintendent* to contact logistics
- G. Logistics division will release the good that asked to be delivered to pertinent ship

- H. If there are insufficiency of supply or defrayment, the logistics will deliver the invoice of material requisition to accounting and finance division
- I. Accounting and finance division will conduct the payment invoice
- J. *Ship Master* will deliver its good to the crew to be used regularly
- K. The crew give the report to *Chief Officer* about the good that have accepted
- L. *Chief Officer* will make a acceptance report and must be signated by *Ship Master*
- M. *Ship Master* deliver the acceptance report to *Assistant Superintendent*
- N. *Assistant Superintendent* deliver the acceptance report to *Superintendent*
- O. Having the requisition and acceptance report have checked by *Superintendent*, that's report will be enclosed by fleet administration

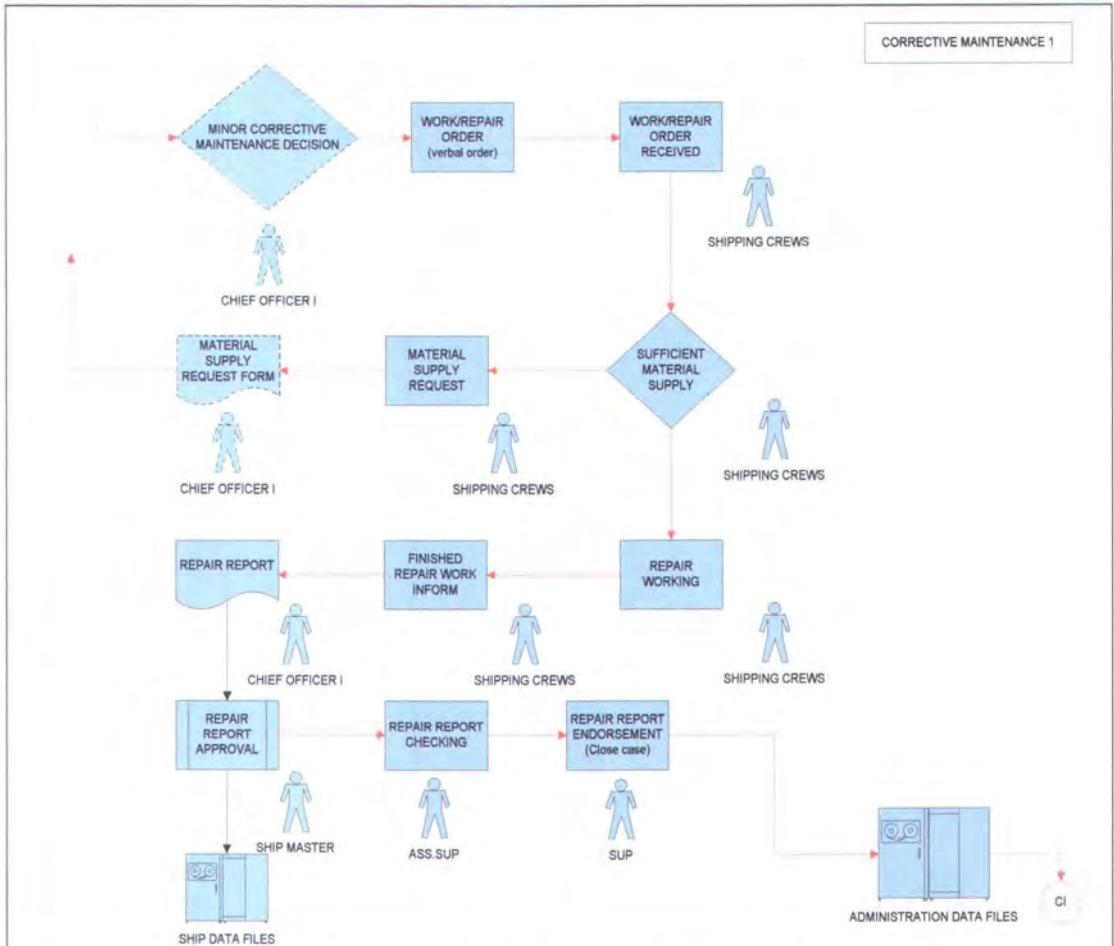

In Failure Reporting like this picture below:

*Figure 4.3: Failure Reporting*

- i. Every inspection between the preventive maintenance also reporting the failure. Absolutely the shipping crew as the inspector person. Every non conformity evidences should be informed to chief officer. And then Chief Officer should write in to the non conformity or failure report.
- ii. The classification report or note being the ultimate consideration for hazard identification. Because it has a connection directly for certification of the ship.
- iii. Will be divide into 2 term, there are corrective maintenance with minor and major case.

In the simply corrective maintenance, it means repair work be done by the shipping crew, like the picture below:

*Figure 4.4: Corrective Maintenance (Minor)*

- i. The decision making for minor status of failure is chief officer
- ii. Every form for the hull corrective maintenance should be written by chief officer
- iii. Ship master give an approval sign for every report which came out from ship authority.
- iv. The completion for every report is the responsibilities for the assistant superintendent.

In major corrective maintenance case, the workflow until closing work order like this picture below:

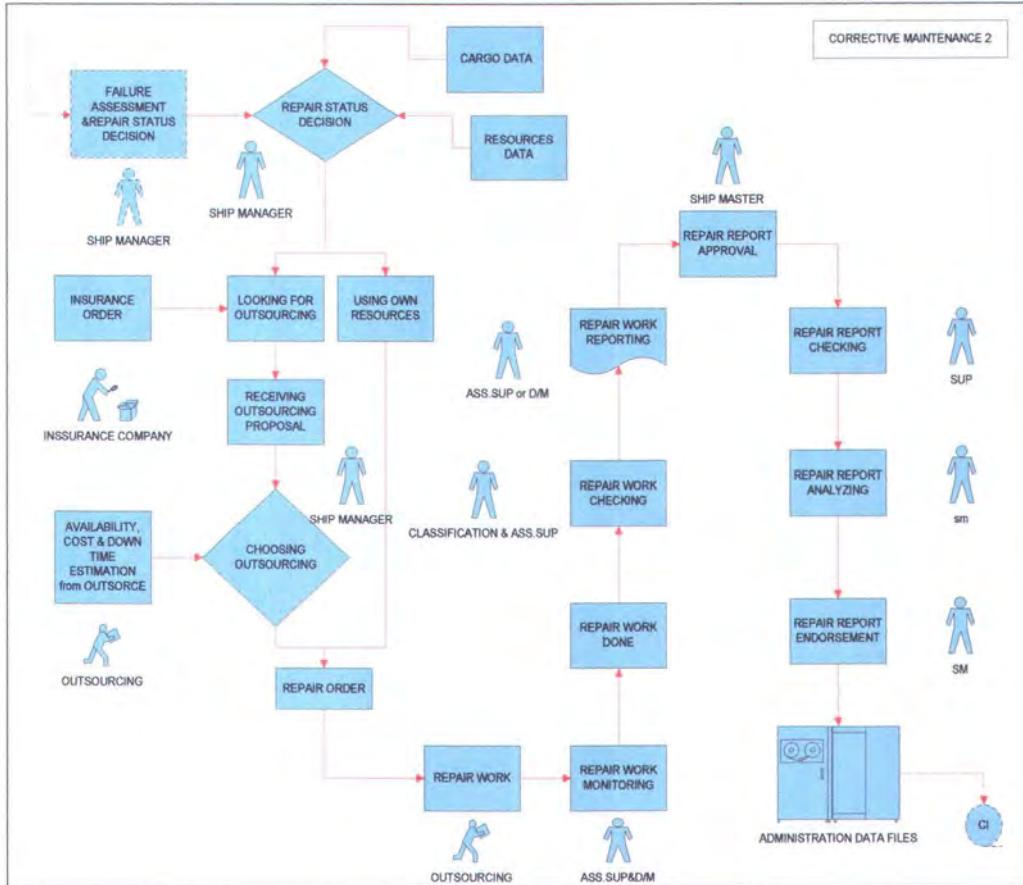

Figure 4.5: Corrective Maintenance (Major)

- i. The Repair Status Decision Making is Ship Manager
- ii. Because the Major Failure Level, the reparation working will be given to outsource, as a partner of Shipping Company for maintenance work.
- iii. Choosing outsource will be a new task for ship manager after decide to repairing the ship by outsource. The outsource selection must consider the insurance order as a major factor. The repair cost will be paid by insurance company according to the polish assurance, if only the hull failure including in insurance agreement. As a minor factor, the income estimation is worthy to get

attention, because after choose any repair place from insurance reference, the shipping company wouldn't sacrifice the hug income to choose the repair place. Also with the cost & down time work that be offered by subcontractor & dockyard, availability space for the vessel must support the repair execution. That being compared with the other outsource repair list, to obtain the minimum cost & down time.

- iv. Every works will be monitor by Dock Monitoring or assistant superintendent if Dock Monitoring unattended to monitor the repair works.
- v. At the closing work order, after every form is checked by Fleet Officer, the report should filing in administration for securing data.

The Business Process of Meratus Hull Corrective Maintenance, like shown below:

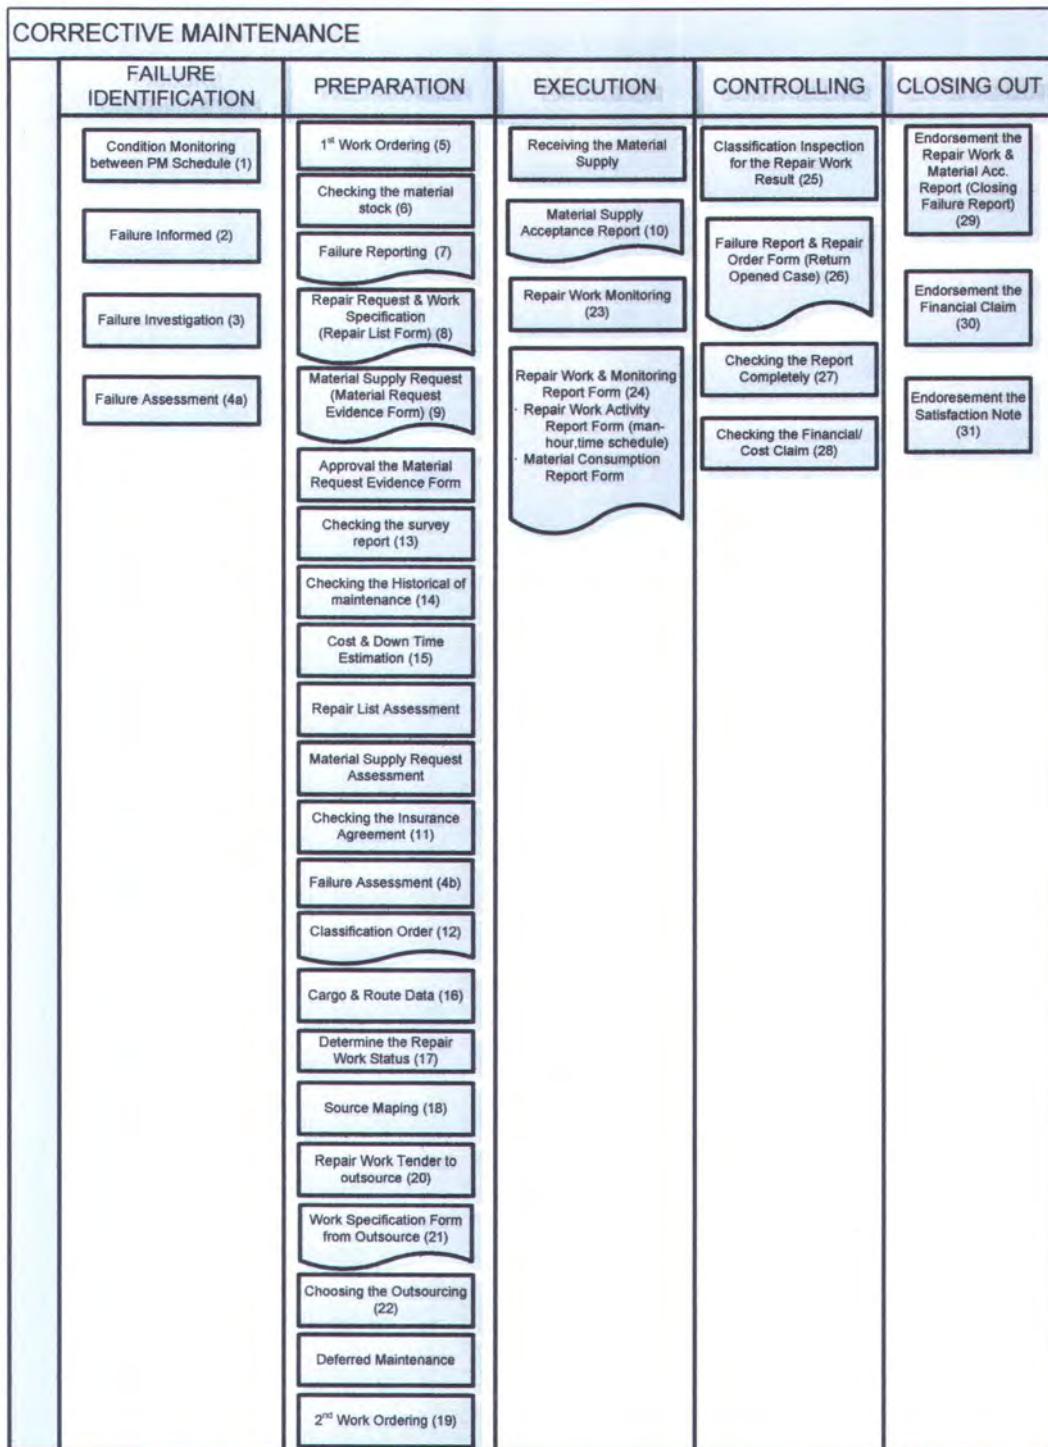

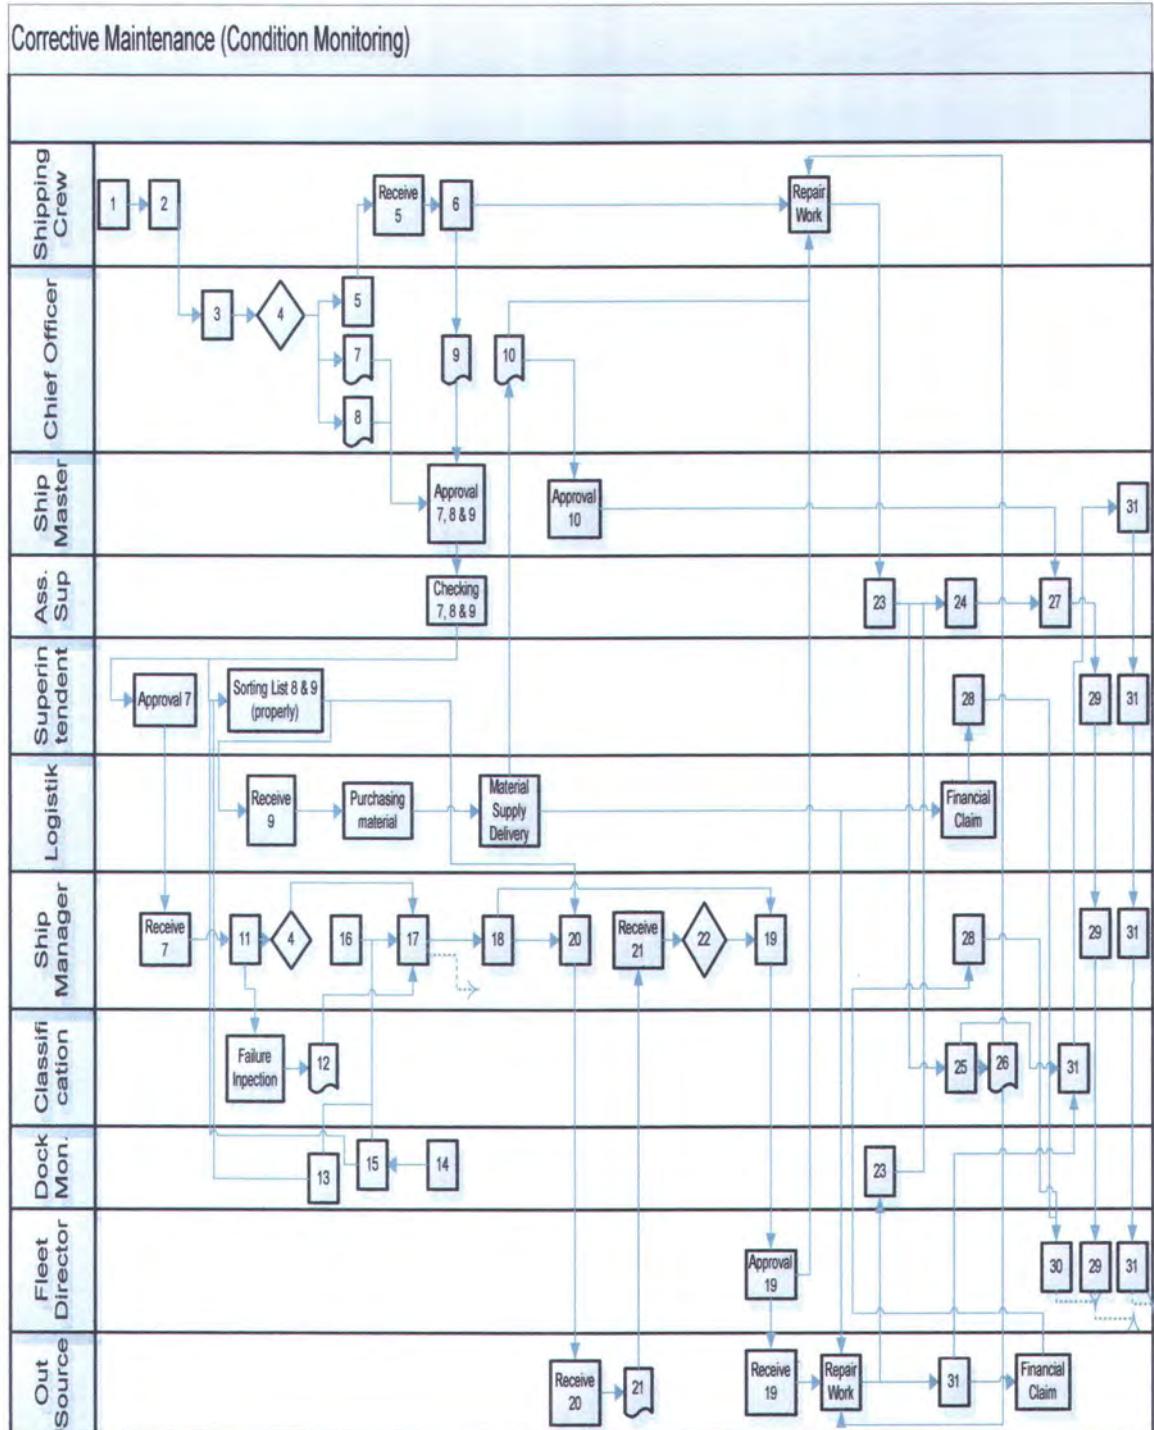

Figure 4.6: Corrective Maintenance Plotting Area

The Business Process of Corrective Maintenance, divide into 2 terms. The Corrective Maintenance refers to condition monitoring, like shown below:

The Corrective Maintenance refers to Planned Maintenance:

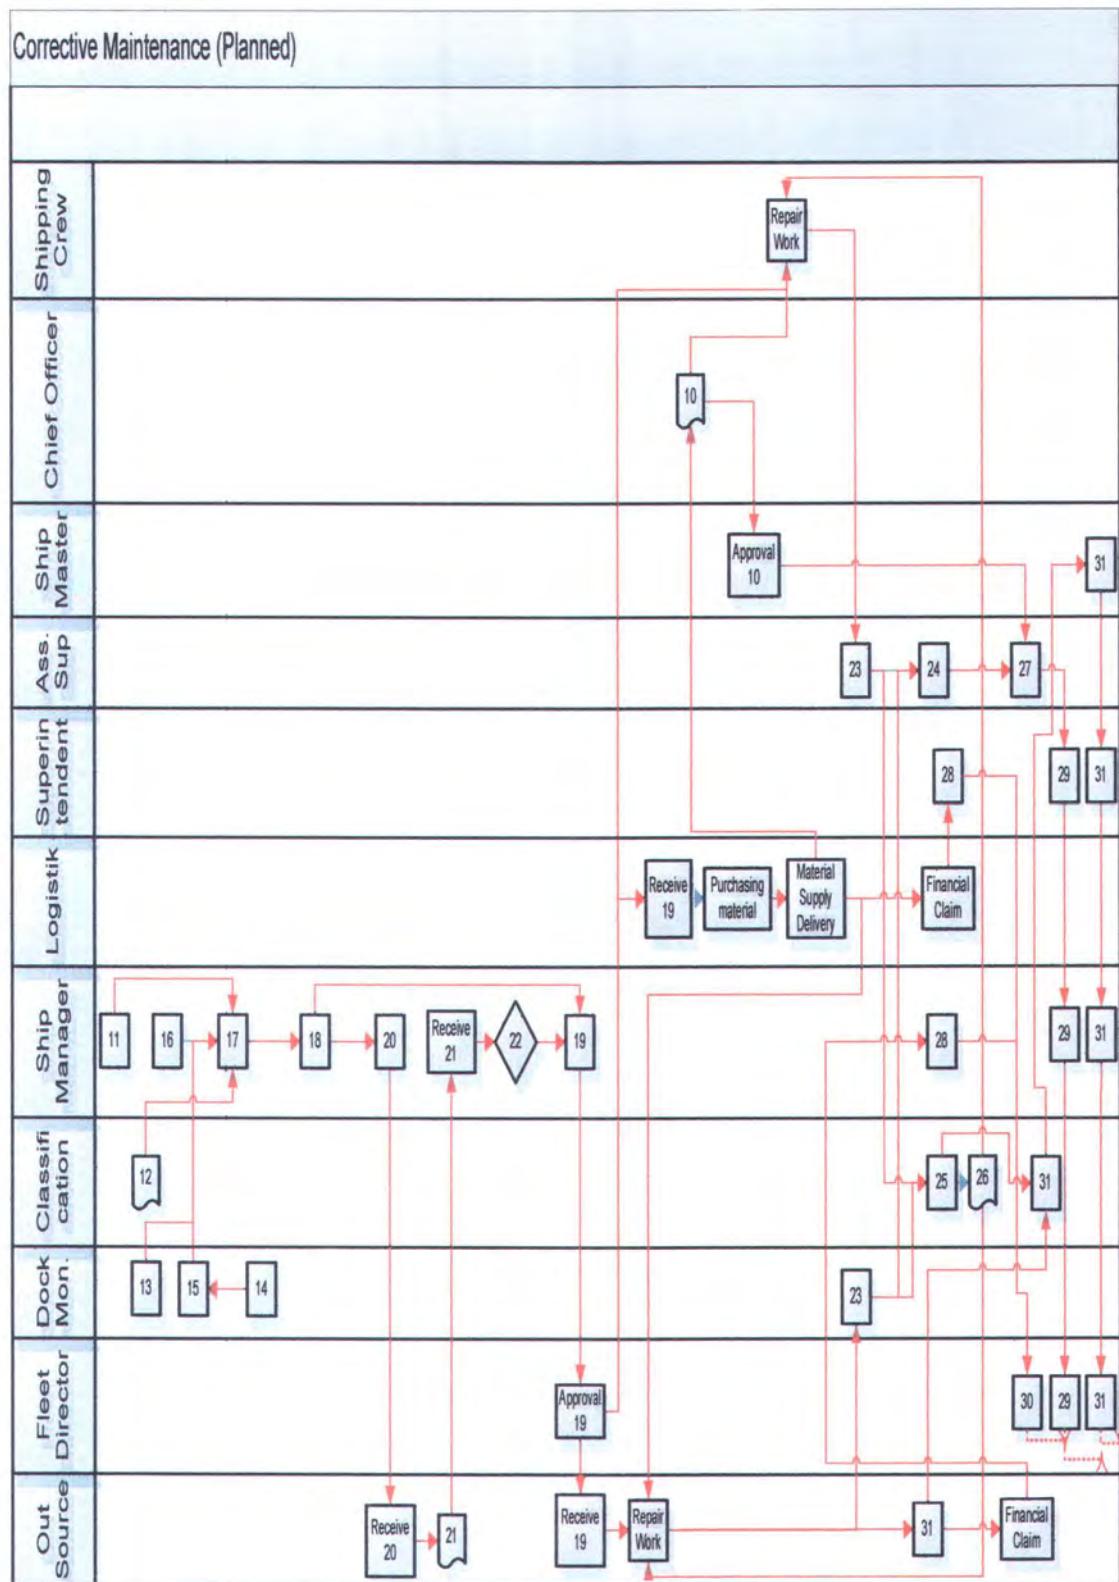

Figure 4.8 : Corrective Maintenance (Planned Maintenance)

#### **4.5 Constructing the Entity Relationship Diagram**

Defined the sequence in hull corrective maintenance for each related person and unit in Meratus Shipping Company the next step is to make and entity relationship diagram (E-R diagram). E-R diagram is tool to describe the data requirements and assumptions in the system from a top-down perspective. E-R diagram also illustrate the logical structure of database.

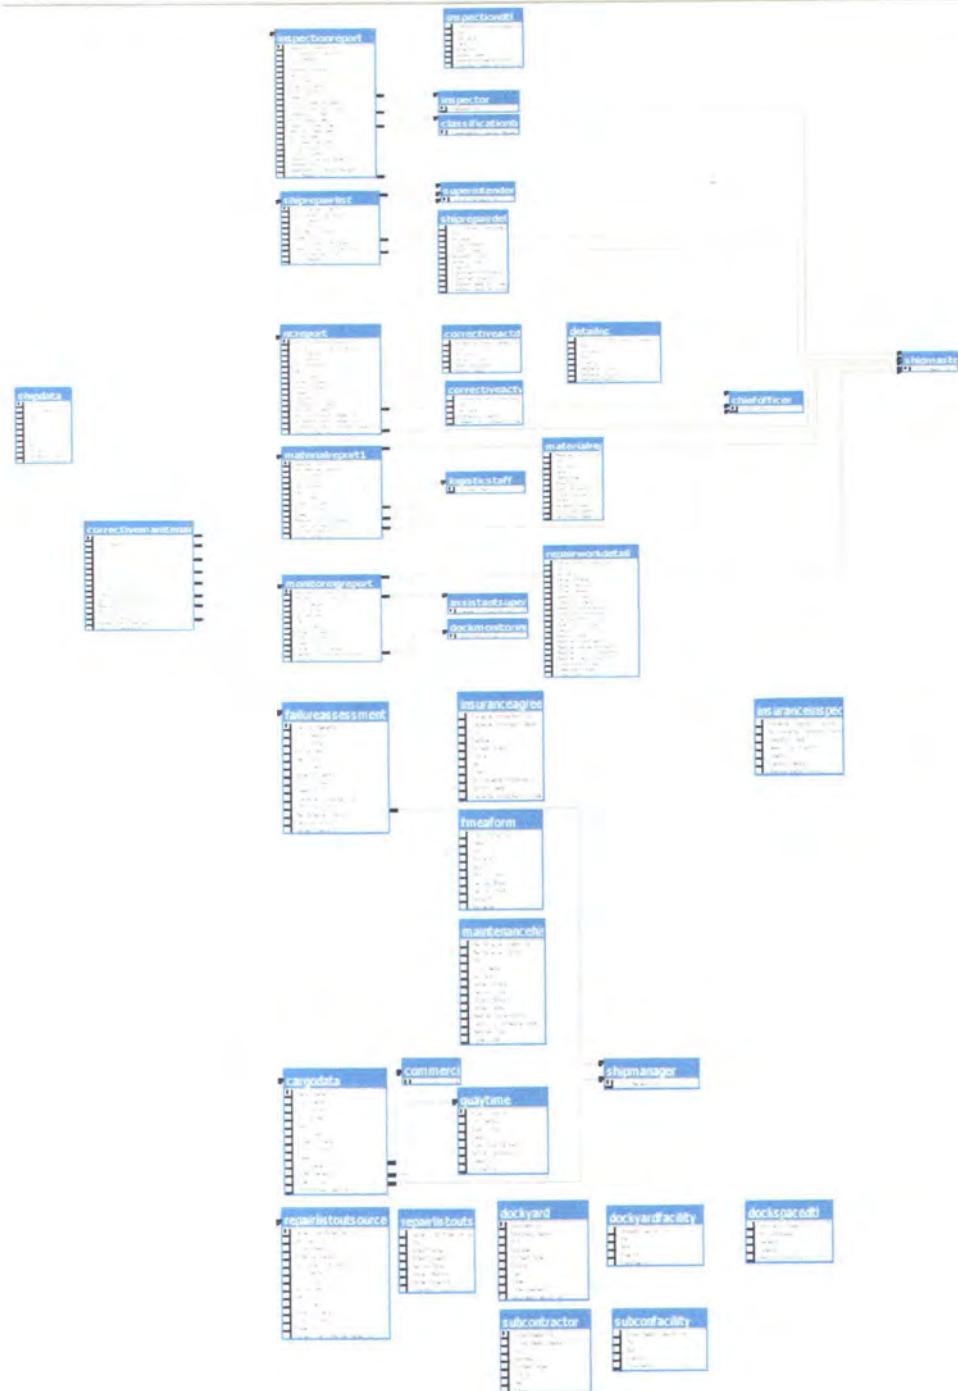

There are three basic elements in ER models:

1. Entities are the "things" about which we seek information.
2. Attributes are the data we collect about the entities.
3. Relationships provide the structure needed to draw information from multiple entities.

Developing an E-R diagram requires an understanding of the system and its components. The step to build E-R diagram is:

1. Define Entities: these are usually nouns used in descriptions of the system
2. Define Relationships: these are usually verbs used in descriptions of the system

For the example, there are the E-R diagrams in Corrective Maintenance for Hull Maintenance Database use SQL Server.

*Figure 4.9 : E – R Diagram for Hull Corrective Maintenance*

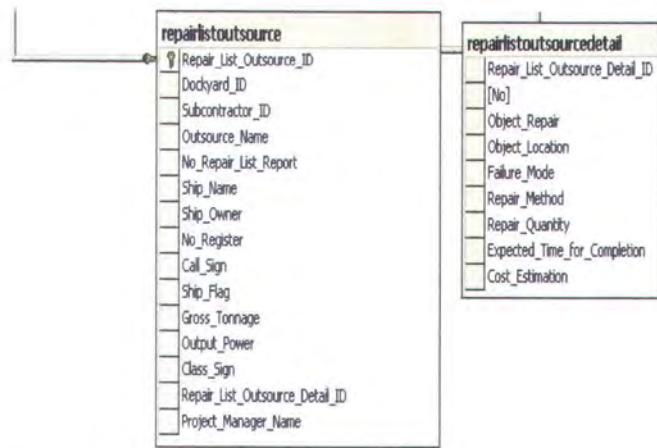

Figure 4.17: E – R Diagram for Repairlist Outsource

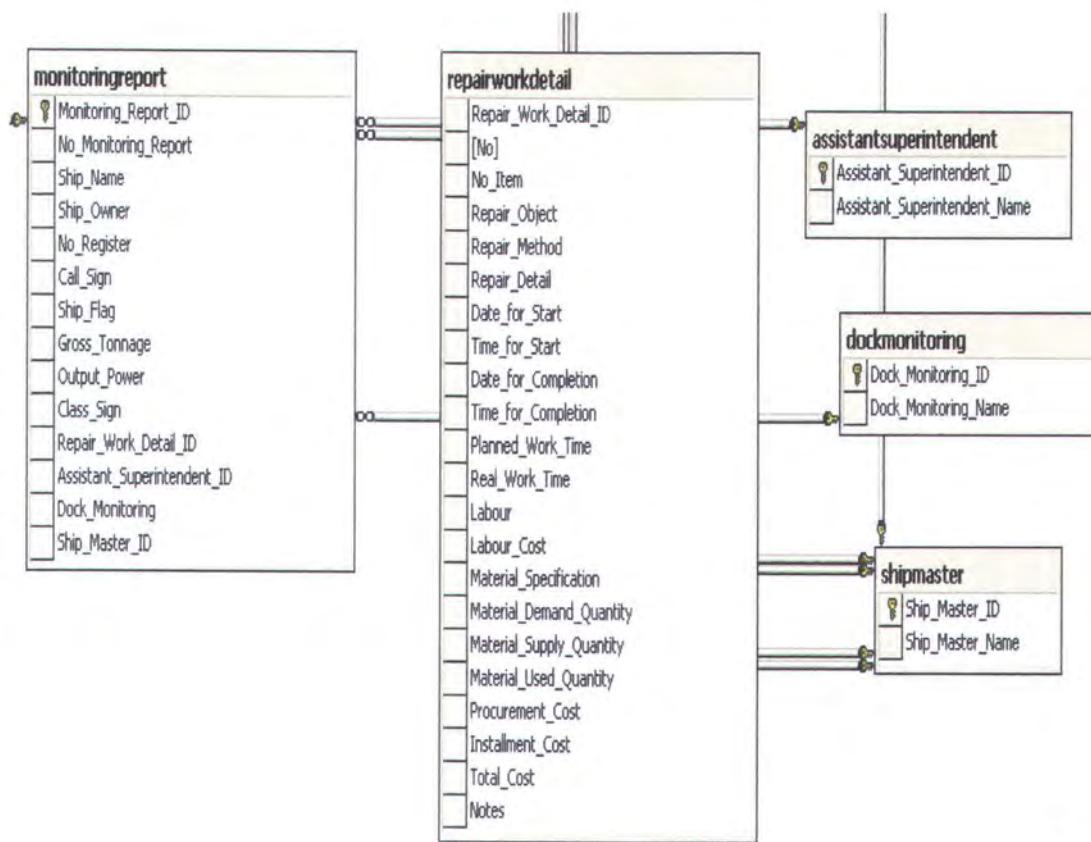

Figure 4.18: E – R Diagram for Monitoring Report

## 4.6 Physical Table Design

Designing of this Corrective Maintenance Module will be dividing into:

### - Database Design

Data kept in a storage data base by a system that called database management system.

As for stages the steps to design of data subsystem shall be as follows:

#### a. Analysis step

At this phase is analyzed the workflow or relationship that happened among entity.

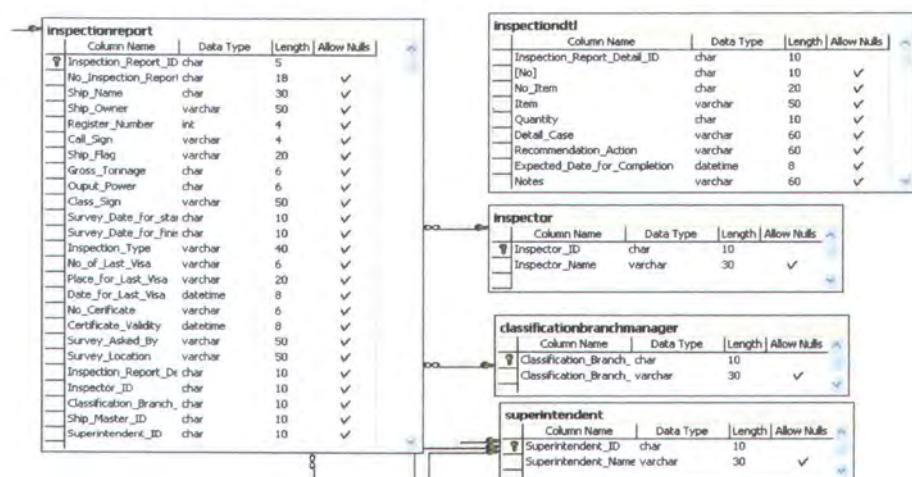

#### b. Logical database design step

Adding an attributes to the entity at this phase.

#### c. Physical design step

At this step we will create a new table in form of physical.

The picture below will give us such of sample of physical table, which created in Microsoft SQL Server.

Picture 4.19: Physical table Inspection form in Microsoft SQL Server

**cargodata**

Column Name	Data Type	Length	Allow Nulls
Cargo_Data_ID	char	5	
Ship_Name	varchar	30	✓
Ship_Owner	varchar	50	✓
No_Register	int	4	✓
Call_Sign	varchar	4	✓
Ship_Flag	varchar	20	✓
Gross_Tonnage	char	6	✓
Output_Power	char	6	✓
Class_Sign	varchar	50	✓
Ship_Data_ID	char	4	✓
Total_Capacity	char	6	✓
Quay_Time_ID	char	10	✓
Commercial_Staff_ID	char	10	✓
Ship_Manager_ID	char	10	✓

**quaytime**

## 4.7 User Interface Design

- Design the user interface for Corrective Maintenance DBMS

The facility to integrate the system with the user interface. With the Microsoft Visual Basic 6.0 software, user interface have been created. And being hope that this design as known as user friendly software for Hull Corrective Maintenance Database System. There are some such of example the user interface.

Picture 4.24: User Interface Corrective Main menu create using Visual Basic 6

## 4.8 Source Code Program

Therefore, in constructing the software application, we need some source code program, as known as syntax program. It will help to translate our software requirement, into programming code that have been recognized by software language programming. By using the logical and computerize ability, build the software environment for our interface form. The first thing that we should know how to change the program setting, called as Properties use.

Picture 4.42: Properties tool for Assistant Superintendent form

And other way we need some source code software for the interface dock access. For the example, when we press the command button in interface from, the command button will receive our order and then try to seek the source code that we have been written. With the source code, our environment programs will be change obey our order after the running programs.

For the examples, some of source codes program will be shown below:

***Source Code for commonly load the programming variables***

***(Assistant Superintendent Form)***

Option Explicit

Private Sub datagrid\_Load()

Set grdDataGrid.DataSource =

datPrimaryRS.Recordset("ChildCMD").UnderlyingValue

End Sub

Private Sub Form\_Unload(Cancel As Integer)

Screen.MousePointer = vbDefault

End Sub

Private Sub datPrimaryRS\_Error(ByVal ErrorNumber As Long,

Description As String, ByVal Scode As Long, ByVal Source As

String, ByVal HelpFile As String, ByVal HelpContext As Long,

fCancelDisplay As Boolean)

'This is where you would put error handling code

'If you want to ignore errors, comment out the next line

'If you want to trap them, add code here to handle them

MsgBox "Data error event hit err:" & Description

End Sub

Private Sub datPrimaryRS\_MoveComplete(ByVal adReason As

ADODB.EventReasonEnum, ByVal pError As ADODB.Error,

```
adStatus As ADODB.EventStatusEnum, ByVal pRecordset As  
ADODB.Recordset)
```

```
'This will display the current record position for this recordset
```

```
datPrimaryRS.Caption = "Record: " &  
CStr(datPrimaryRS.Recordset.AbsolutePosition)
```

```
End Sub
```

```
Private Sub datPrimaryRS_WillChangeRecord(ByVal adReason As  
ADODB.EventReasonEnum, ByVal cRecords As Long, adStatus As

Picture 4.43: Source Code for Assistant Superintendent Form

When our source code programs that we have been written was right, the programs implementation have been succeeded to the test connection. But if our source code was wrong, it will be shown by warning message box. Then we should fix our source code, as known as debugging programs. After we finish writing every source codes programs, keep in mind to always try to running the programs. It will help us to obtain the software failure identification as soon as possible. So we may not to fix the complicated and large of software source codes in other time.

## **CHAPTER V**

### **CONCLUSION AND SUGGESTION**

# **CHAPTER V**

## **CONCLUSION AND SUGGESTION**

After finished the final project, we should evaluated and analyzed the implementation of the Hull Corrective Maintenance Module. According to the evaluation and analyzing from this final project, we obtained some conclusion and suggestion concerning this final project.

### **5.1 Conclusion**

Based on the evaluation, we got some conclusions that will be explained below:

- a. With the implementation of Hull Corrective Maintenance Module, expected will assist the performance from hull maintenance reporting especially in corrective maintenance. Depository and data seeking more efficient than using a lot of paper sheet.
- b. Hull Corrective Maintenance Module also assists the data access from many persons related in maintenance connection. Not only in one division (Fleet Division), but also with the other (Commercial Staff).
- c. There are directly connections between failure evidences, insurance agreements, and maintenance history also cargos data to determine the repair status. And then it will become one of consideration to choosing outsource for hull maintenance.

## **5.2 Suggestion**

As for suggestion which can be obtained by after running the Hull Corrective Maintenance Module shall be explain as follows:

- a. By giving attention to this Hull Corrective Maintenance Module, next time perhaps there will be an internal software development (components). For improvement connection or integration programs with a good information management system in shipping companies.
- b. Integration with the other key maintenance area ought to conduct. With the other word, perhaps there will be development of planning/scheduling and continuous improvement maintenance module.

## **APPENDIX**

# USER INTERFACE FOR HULL CORRECTIVE MAINTENANCE MODULE

The user interface for the Hull Corrective Maintenance Module consists of twelve windows arranged in a 3x4 grid:

- Corrective Maintenance:** Main dashboard with navigation links for Inspection Report, Failure Report, Journal Report, Monitoring Report, Ship Data, Failure Assessment, Ship Repair List, Cargo Data, Outsource Data, and Repair List from Outsource.
- Inspection Report:** Detailed report showing inspection details for a specific vessel, including inspection date, location, and results.
- Inspection Detail Report:** Detailed report showing inspection details for a specific vessel, including inspection date, location, and results.
- Failure Report:** Form to enter failure details, including failure type, location, and description.
- Failure Report Detail:** Detailed view of a failure report with specific failure details.
- Corrective Action Detail Report:** Detailed report showing corrective action details for a specific vessel, including action type, location, and results.
- Corrective Action Verified Detail:** Detailed report showing corrective action verified details for a specific vessel, including verification status and results.
- Material Report:** Form to enter material details, including material type, location, and description.
- Material Report Detail:** Detailed view of a material report with specific material details.
- Monitoring Report:** Form to enter monitoring details, including monitoring type, location, and results.
- Repair Work Detail:** Form to enter repair work details, including work type, location, and results.
- Ship Repair List:** Form to enter ship repair list details, including repair type, location, and results.
- Ship Repair List Detail:** Detailed view of a ship repair list with specific repair details.
- Repair List Outsource:** Form to enter repair list outsource details, including outsource type, location, and results.
- Repair List Outsource Detail:** Detailed view of a repair list outsource with specific outsource details.

Survey Khusus Penundaan Visa Lambung Dan Penundaan Pengedokan

1. Pelat lambung kapal di atas garis air sejauh yang dapat diperiksa keadaan baik, kecuali beberapa bagian kedapatan deformasi, bagian yang deformasi tersebut diperiksa keadaan baik tidak terdapat keretakan dan dilaksanakan uji kedap keadaan baik.

Rekomendasi

Pelat lambung beserta gading yang deformasi agar dipotong dan diganti baru paling lambat Juli 2003, yaitu:

- Pelat antara gd. No. 39 - 42/43 (ki) berbatasan dengan geladak kedua
  - Gading No. 104 (ki) dua lajur diatas geladak kedua.
  - Pelat antara gd. No. 105/106 - 107 (ki) dua lajur diatas geladak kedua.
  - Pelat antara gd. No. 108 - 109 (ki) tiga lajur diatas geladak kedua.
2. Pelat geladak utama, pelat geladak kedua dan pelat alas ganda diperiksa keadaan baik.
  3. Pelat sekat kedap melintang diperiksa keadaan baik, kecuali beberapa bagian kedapatan tipis didoubling dan deformasi, pelat-pelat sekat yang kedapatan tipis didoubling dan deformasi diperiksa tidak terdapat keretakan dan diuji kedap hasil baik.

Rekomendasi

Pelat sekat kedap melintang yang kedapatan tipis didoubling dan deformasi agar dipotong dan diganti baru paling lambat Juli 2003, yaitu:

- Pelat sekat antara ruang muat I dan II (pada gd. No. 101) berbatasan dengan geladak kedua (ki/ka)
  - Pelat sekat antara ruang muat II dan III (pada gd. No. 67) berbatasan dengan geladak kedua (ki)
  - Pelat sekat antara ruang muat III dan kamar mesin (pada gd. No. 33) satu lajur diatas geladak kedua (ki)
4. Bagian-bagian konstruksi di dalam Fore castle space, ruang muat I, II dan III, kamar mesin, dan ruang instalasi kemudi diperiksa keadaan baik., kecuali beberapa bracket untuk gading-gading ke tank top pada ruang muat kedapatan tipis.

Rekomendasi

Bracket gading-gading ke tank top yang kedapatan tipis pada gd. No. 43 – 46 (ki) dan pada gd. No. 48 – 53 (ki) agar dipotong dan diganti baru paling lambat Juli 2003.

5. Sumur-sumur bilga di ruang muat dan kamar mesin diperiksa secara umum, keadaan baik dan tidak ada tanda-tanda kebocoran.
6. Stuffing box poros baling-baling beserta sistem kekedapannya diperiksa eksternal dari dalam kamar mesin keadaan baik dan tidak terdapat kebocoran yang berlebih.
7. Ambang palka beserta penutupannya diperiksa keadaan baik.

8. Rumah geladak, pintu kedap cuaca, jendela dan engine skylight diperiksa keadaan baik
9. Bulwark (ki/ka) diperiksa keadaan baik.
10. Perlengkapan jangkar (ki/ka) dan peralatan tambat diperiksa visual keadaan terpasang baik di kapal.
11. Log book deck diperiksa dan berdasarkan informasi Nakhoda, kapal tidak pernah mengalami kerusakan yang serius atau tanda-tanda yang membahayakan pada bagian bawah garis air sejak pengedokan terakhir.

#### REKOMENDASI

Survey Pengedokan agar dilaksanakan paling lambat Juli 2003

#### CATATAN :

- Survey Alas terakhir 08 Januari 2001

SURVEYOR

ONOT SUBAGYO

Docking survey , Intermediate survey and Continuous Machinery Survey were carried out and reported as follows :

## I. HULL

### 1. Shell Plating

Bottom and side plating, stem and stern frames clean, thickness measurement carried out, examined and found to be satisfactory.

Damage parts of side plate cropped off and renewed as follows,

- starboard

Strake F/G between fr.35/36 - 38/39, size approx. 1750 x 1300 x 10 mm.

- stem plate.

Strake C - F , size approx. 3100 x 1050 x 10 mm.

Plate E/F , size approx. 900 x 700 x 12 mm

- some welding seam buildup by welding, examined and found to be satisfactory.

### 2. Deck Plating

Main deck, thickness measurement carried out, examined and found to be satisfactory.

Upper deck, boat deck, fore castle deck , visual inspection and found to be satisfactory.

### 3. Bulkhead

Transverse bulkhead examined and found to be satisfactory.

### 4. Tanks

Following tanks opened up, cleaned for internal survey, and hydraulic pressure test carried out found satisfactory

- Fore Peak Tank

- After Peak Tank

### 5. Sea Chests

Grating removed, chests cleaned, examined and found to be satisfactory  
steel surface recoated and gratings refitted.

### 6. Bower Anchor and Chain

- Bower anchor port and starboard side cleaned, examined and found to be satisfactory.
- Swivel port and starboard side cleaned, examined and found to be satisfactory.
- Chain anchor port and starboard side cleaned, examined and found to be satisfactory.

### 7. Rudder Stock and Rudder Blade

- Rudder Blade cleaned, damaged plate to be cropped off and renewed partly, hydraulic pressure test carried out and examined , and found to be satisfactory.
- Maximum bearing clearances recorded as follow :

Upper pintle 0,65 mm

Bottom pintle 2,90 mm

### 8. Thickness Measurements

Thickness measurements carried out by QA SYSTEMS PTE LTD. In order
