## **Abstrak**

*Jalan Tol Terbanggi Besar – Pematang Panggang, Provinsi Lampung adalah salah satu ruas dari Jalan Tol Trans Sumatera yang memiliki total panjang 108,6 KM. Dalam proyek ini dilakukan penyesuaian elevasi dengan penimbunan dan pemotongan. Penimbunan yang dilakukan beragam, pada STA 28+600 – STA 29+850 memiliki tinggi maksimal 10 meter dan STA 41+100 – STA 42+350 memiliki tinggi maksimal 7 meter.*

*Melalui data tanah di lokasi proyek didapatkan kondisinya yaitu tanah lunak. Kondisi tanah seperti ini sangat tidak menguntungkan untuk dibangun bangunan di atasnya karena memiliki daya dukung yang kecil dan pemampatan yang besar. Oleh sebab itu perlu adanya sebuah metode perbaikan tanah untuk mengatasi permasalahan tersebut. Dalam perencanaan ini akan digunakan metode preloading. Metode preloading sendiri yaitu memberi beban terhadap tanah asli agar air dapat keluar dan mempercepat proses pemampatan. Untuk pengaliran air dari tanah asli ke permukaan dibantu Prefabricated Vertical Drain (PVD) yang terbuat dari bahan geosintetik atau plastik berbahan khusus.*

*Elevasi timbunan rencana yang terbilang cukup tinggi juga memerlukan adanya metode perkuatan lereng agar tidak terjadi longsor. Alternatif perencanaan perkuatan yang*

*digunakan yaitu geotextile, cerucuk, dan kombinasi dari keduanya. Geotextile yaitu sebuah geosintetik yang ditanam di dalam timbunan, sedangkan cerucuk berupa tiang yang ditanam di bawah timbunan hingga kedalaman tertentu untuk mencegah adanya longsor. Pemilihan metode perkuatan lereng akan dipilih yang paling murah dari segi biaya material.*

*Tanah yang beragam memerlukan pembagian zona kondisi tanah, section 28 dibagi menjadi zona B1 dan B2, lalu section 41 dibagi menjadi zona B27 dan B30. Kedalaman PVD yang diperlukan beragam, terpendek 4 meter dan terpanjang 8 meter. PVD menggunakan pola pemasangan segitiga dengan jarak antar PVD 2,25 meter. Alternatif perkuatan lereng yang paling murah adalah Geotextile.*

### **Abstract**

*Terbanggi Besar – Pematang Panggang toll located at Lampung Province is one of trans sumatra toll with 108,6 KM total length. In this project, undertaken an adjustments elevation with cutting and filling. There are various height of filling have been done, STA 28+600 – STA 29+850 has maximum height in 10 meters and STA 41+100 – STA 42+350 has maximum height in 7 meters.*

*Through soil test from the location, obtained the condition of the land is soft soil . This kind of land conditions is really unprofitable to build any building above it because it has small carrying capacity and great compression. Therefore, it requires a soil improvement method to overcome this problem. In this plan, will be using preloading method. Preloading method itself is giving load against the origin soil so that water may be out and speed up the compression process. The drainage of water from the origin soil to the surface helped by Prefabricated Vertical Drain (PVD) which made by geosynthetic material or special made plastic.*

*Plan of the embankment elevation that quite high also need a slope reinforcement method to avoid the landslide. There are alternative reinforcement plans will be used; geotextile, micropile, and combination of both. Geotextile is a geosynthetic material planted within the embankment, while the form of micropile is a pole planted under the embankment in particular depth to avoid the landslide. The slope reinforcement method will be chosen by the cheapest cost materials.*

*There are various depth of PVD will be required, 4 meters shortest and 8 meters longest. The PVD is using triangle installation pattern with 2,25 meters space in between. The cheapest slope reinforcement alternative is Geotextile.*

***Keywordsi: Embankment, PVD, Geotextile, Micropile, Terbanggi Besar Toll Road***

## **KATA PENGANTAR**

Puji syukur kehadirat Allah SWT karena atas segala rahmat, karunia, dan hidayah-Nya penyusunan proposal Tugas Akhir dengan judul “Perencanaan Perbaikan Tanah pada Jalan Tol Terbanggi Besar – Pematang Panggang STA 28+600 – 29+850 dan STA 41+000 – STA 42+350” dapat tersusun dengan baik. Tidak lupa juga saya ucapkan banyak terima kasih kepada:

1. Bapak Dr. Trihanydio Rendy S., S.T., M.T. dan Bapak Musta'in Arif, S.T., M.T. selaku dosen pembimbing, yang telah membimbing saya dalam penyusunan tugas akhir ini.
2. Sahabat Fauzan Umar Faruq, S.T. yang selalu siap membantu dan mengajari saya sejak laporan MPT, proposal tugas akhir, dan laporan tugas akhir.
3. Kekasih hati Aulya Setyo Pratiwi, S.KG. yang sepenuh hati mendukung saya dalam penyusunan tugas akhir pada khususnya dan dalam hidup pada umumnya.
4. Teman-teman mahasiswa departemen Teknik Sipil dari berbagai angkatan yang telah membantu dan memberi informasi dalam penyusunan tugas akhir ini.

Dalam penulisan laporan ini, saya sadari bahwa masih ada kekurangan. Oleh karenanya kritik dan saran yang bersifat membangun sangat diharapkan demi kebaikan laporan ini. Harapan saya semoga laporan ini dapat memberikan manfaat bagi pembaca, penulis, dan semua pihak yang turut membantu dalam penyusunan.

Surabaya, Januari 2019

# BAB 1

## PENDAHULUAN

### 1.1. Latar Belakang

Jalan Tol Trans Sumatera (JTTS) direncanakan akan membentang dari utara Pulau Sumatera hingga selatan. Menggabungkan Provinsi Nangroe Aceh Darussalam sampai Provinsi Lampung seperti **Gambar 1.1**. Jalan Tol Terbanggi Besar – Pematang Panggang adalah salah satu ruas dari Jalan Tol Trans Sumatera yang memiliki panjang 108,6 KM dan melewati 4 Kabupaten, 13 Kecamatan, dan 33 Desa (**Gambar 1.2**). Jalan tol ini dibuat dengan tujuan untuk meningkatkan aksesibilitas dan kapasitas jaringan jalan di Sumatera serta meningkatkan produktifitas melalui pengurangan biaya distribusi. Selain itu Jalan Tol Trans Sumatera ini dibuat untuk persiapan Sea Games 2018 yang dimana Indonesia menjadi tuan rumahnya. Biaya investasi yang dikeluarkan pemerintah sebesar Rp 11,646 Triliun dengan target selesai pada tahun 2019 untuk Jalan Tol Trans Sumatera pada umumnya dan pada Maret 2018 untuk Jalan Tol Terbanggi Besar – Pematang Panggang khususnya.

**Gambar 1.1** Peta Jalan Tol Trans Sumatera  
(sumber : Wikipedia)

Proyek Jalan Tol Terbanggi Besar – Pematang Panggang hingga sekarang masih pada tahap menimbun sepanjang 13 KM, dan sebagian lainnya masih tahap pembebasan lahan, karena kebanyakan adalah kebun dan sawah dari penduduk sekitar. Waktu yang tersisa kurang dari setahun oleh karenanya proyek ini perlu untuk segera dikerjakan.

Jalan Tol Terbanggi Besar – Pematang Panggang melintasi bukit dan lembah, dalam pembuatan jalan akan dilakukan *cut and fill* (pemotongan dan penimbunan). Dalam Tugas Akhir ini hanya mengambil daerah yang dilakukan penimbunan yaitu pada STA 28+600 – STA 29+850 dan STA 41+000 – STA 42+350. Setelah memahami dengan baik data tanah asli akan dilakukan pembagian zona dan pembagian tinggi timbunan rencana dan analisa dilakukan pada tiap STA 50 meter. Setelah itu baru akan dilakukan proses perbaikan tanah dan perkuatan lereng.

**Gambar 1.2** Lokasi Jalan Tol Terbanggi Besar – Pematang Panggang  
(sumber : bumn.go.id)

Data tanah yang didapatkan di lapangan menunjukkan bahwasanya tanah didominasi oleh lempung dengan  $N_{spt}$  yang beragam kisaran antara 4 hingga 9. Tanah seperti ini tidak menguntungkan untuk dibangun bangunan diatasnya, karena daya dukung kecil dan juga dapat terjadi pemampatan yang besar oleh

tanah asli. Oleh sebab itu, perencanaan jalan ini memerlukan suatu metode perbaikan tanah yang mampu untuk menghilangkan pemampatan dan meningkatkan daya dukung pada tanah dasar. Metode perbaikan tanah yang akan digunakan dalam perencanaan ini adalah *preloading* yang dibantu dengan *prefabricated vertical drain (PVD)*. Selain itu  $N_{spt}$  yang didapat melalui data tanah sangat beragam artinya tanah memiliki karakteristik yang berbeda beda, oleh karena itu perlu dilakukan analisa data tanah dan pembagian zona tanah untuk tiap STA.

Data tanah juga menunjukkan bahwasanya rencana elevasi timbunan cukup tinggi yang tentu saja akan rawan terhadap longsor di lerengnya. Oleh karena itu perlu direncanakan agar lereng timbunan cukup kuat menahan longsor. Untuk metode perkuatan akan digunakan *micropile*, *geotextile*, dan kombinasi dari *geotextile & micropile*.

*Preloading* adalah salah satu cara perbaikan tanah yang efektif dengan konsep menghilangkan air dari tanah asli sehingga memaksa tanah untuk mempercepat proses konsolidasi. Tanah dasar akan diberi beban timbunan lalu dibantu dengan *prefabricated vertical drain (PVD)* yang terbuat dari plastik berbahan khusus untuk mengalirkan air ke permukaan.

Perkuatan lereng timbunan ada tiga perencanaan yaitu *micropile*, *geotextile*, dan perkuatan kombinasi *micropile & geotextile*. *Micropile* secara konsepnya yaitu pemasangan tiang dibawah timbunan hingga kedalaman tertentu agar dapat menahan gaya longsor timbunan. *Geotextile* secara konsep yaitu sebuah geosintetik yang ikut ditanam di dalam timbunan yang memiliki kuat tarik sehingga timbunan tidak longsor. Adapun dari semua metode di atas akan dihitung metode dengan biaya termurah.

## 1.2. Perumusan Masalah

Adapun rumusan masalah dalam Tugas Akhir ini adalah sebagai berikut :

1. Bagaimana pembagian zona kondisi tanah dari jalan tol yang ditinjau?

2. Berapa  $H_{initial}$  yang diperlukan untuk mendapatkan tinggi timbunan yang direncanakan dari metode *preloading*?
3. Bagaimana perencanaan kedalaman dan pola PVD yang efektif?
4. Bagaimana perencanaan dalam penggunaan *micropile*, *geotextile*, dan kombinasi *micropile & geotextile*?
5. Berapa kebutuhan panjang *micropile*, *geotextile*, dan kombinasi *micropile & geotextile*?
6. Metode perbaikan tanah dan perkuatan lereng timbunan yang mempunyai biaya material paling murah?

### **1.3. Batasan Masalah**

Adapun batasan masalah dalam penyusunan Tugas Akhir ini adalah sebagai berikut:

1. Data yang digunakan adalah data sekunder
2. Tidak membahas perhitungan geometri dan perkerasan jalan.
3. Tidak merencanakan drainase jalan.
4. Biaya yang dihitung hanya biaya material.

### **1.4. Tujuan Perencanaan**

Adapun tujuan yang ingin dicapai dalam Tugas Akhir ini adalah merencanakan metode perbaikan tanah dan perkuatan timbunan agar mampu menerima beban sehingga tidak terjadi kelongsoran dan perbedaan penurunan yang dapat menyebabkan kerusakan pada Jalan Tol Terbanggi Besar – Pematang Panggang.

### **1.5. Manfaat Perencanaan**

Manfaat dari Penulisan Tugas Akhir ini adalah dapat dijadikan alternatif perbaikan tanah dasar dan perkuatan timbunan. Sehingga dapat dijadikan bahan pertimbangan oleh para pengambil keputusan di Proyek Jalan Tol Terbanggi Besar – Pematang Panggang STA 28+600 – STA 29+850 dan STA 41+000 – STA 42+350.

## BAB II

### TINJAUAN PUSTAKA

#### **2.1 Permasalahan Pembangunan Konstruksi di Atas Tanah Lunak**

Tanah lunak memiliki pemampatan yang bisa mencapai hitungan meter sekaligus lama pemampatannya bisa mencapai tahunan dan memiliki daya dukung yang kecil. Oleh sebab itu tanah lunak merupakan jenis tanah yang tidak menguntungkan untuk digunakan sebagai tanah dasar suatu konstruksi dan patut diwaspadai saat perencanaan dan pelaksanaan konstruksi. **Tabel 2.1** adalah pembagian lapisan tanah didasarkan atas korelasi N-SPT dan qc sondir.

**Tabel 2.1** Korelasi N-SPT dan Konsistensi Tanah

(Sumber : Mochtar,2006; revised,2012)

## 2.2 Pemampatan

Penambahan beban di atas suatu permukaan tanah dapat menyebabkan lapisan tanah di bawahnya mengalami pemampatan. Pemampatan tersebut disebabkan oleh adanya deformasi partikel tanah, relokasi partikel, keluarnya air atau udara dari dalam pori, dan sebab-sebab lain. Beberapa atau semua faktor tersebut mempunyai hubungan dengan keadaan tanah yang bersangkutan. (Das dalam Mochtar, 1998) Secara umum, pemampatan (*settlement*) pada tanah disebabkan oleh pembebanan yang dapat dibagi dalam dua kelompok besar, yaitu:

- Pemampatan konsolidasi (*consolidation settlement*), yang merupakan hasil dari perubahan volume tanah jenuh air sebagai akibat dari keluarnya air yang menempati pori-pori tanah. Pemampatan konsolidasi dibagi menjadi dua bagian, yaitu konsolidasi primer dan konsolidasi sekunder. Namun pada perhitungan pemampatan tanah akibat reklamasi, pemampatan sekunder umumnya diabaikan karena besar pemampatan sangat kecil (Wahyudi, 1997)
- Pemampatan segera (*immediate settlement*), yang merupakan akibat dari deformasi elastis tanah kering, basah, dan jenuh air tanpa adanya perubahan kadar air.

Amplitudo atau besarnya pemampatan tanah total dalam Wahyudi (1997), adalah :

$$S_t = S_i + S_{cp} + S_{cs} + S_{lat}$$

[2.1]

keterangan :

- St       = total *settlement*
- Si       = *immediate settlement*
- Scp      = *consolidation primer settlement*
- Scs      = *consolidation secondary settlement*
- Slat     = *settlement* akibat pergerakan tanah arah lateral.

### 2.2.1 Pemampatan Beban Satu Tahap

Terdapat dua jenis konsolidasi berdasarkan tegangan yang diakibatkan, yaitu :

1. Tanah terkonsolidasi secara normal, *Normally Consolidated Soil* (NC-Soil), di mana tegangan overburden efektif pada saat ini adalah merupakan tegangan maksimum yang pernah dialami tanah tersebut.
2. Tanah terkonsolidasi lebih, *Over Consolidated Soil* (OC-Soil), di mana tegangan overburden efektif saat ini adalah lebih kecil daripada tegangan yang pernah dialami oleh tanah yang bersangkutan sebelumnya.

Tanah disebut NC-Soil atau OC-soil ditentukan dari nilai *Over Consolidation Ratio* (OCR). NC-Soil mempunyai nilai  $OCR \leq 1$  dan OC soil mempunyai nilai  $OCR > 1$ . OCR didefinisikan dengan persamaan berikut ini:

$$OCR = \frac{\sigma_c'}{\sigma_o'}$$

keterangan:

$\sigma_c'$  = effective pre consolidation pressure

$\sigma_o'$  = effective overburden pressure

Secara umum besar pemampatan konsolidasi pada lapisan tanah lempung setebal H dapat dihitung dengan persamaan (Das, 1985):

1. Untuk tanah *Normally Consolidated* (NC-Soil):

$$Sc = C_c \cdot \frac{H_0}{1+e_0} \cdot \log \frac{\sigma_{vo}' + \Delta\sigma}{\sigma_{vo}'}$$

2. Untuk tanah *Over Consolidated* (OC-Soil):

- Bila  $(\sigma_{vo}' + \Delta\sigma) \leq \sigma_c'$ , maka:

$$Sc = \frac{Cs \cdot H_0}{1+e_0} \cdot \log \frac{\sigma_{vo}' + \Delta\sigma}{\sigma_{vo}'}$$

- Bila  $(\sigma_{vo}' + \Delta\sigma) > \sigma_c'$ , maka:

$$Sc = \frac{Cs \cdot H_0}{1+e_0} \cdot \log \frac{\sigma_c'}{\sigma_{vo}'} + \frac{Cc \cdot H_0}{1+e_0} \cdot \log \frac{\sigma_{vo}' + \Delta\sigma}{\sigma_c'}$$

keterangan:

- $Sc$  = besar pemampatan yang terjadi (m)
- $C_c$  = indeks pemampatan (*compression index*)
- $C_s$  = indeks pemuaian (*swelling index*)
- $e_0$  = angka pori
- $\sigma_o'$  = tegangan overburden efektif
- $\Delta\sigma$  = penambahan beban vertikal (beban luar)
- $\sigma_c$  = tegangan prakonsolidasi

Sehingga besar pemampatan total adalah:

$$Sc = \sum_{i=1}^n Sc_i$$

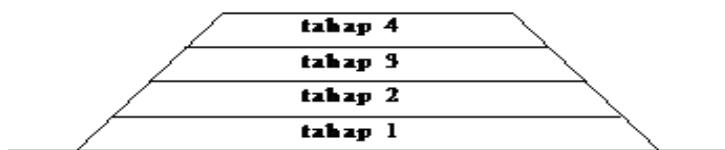

keterangan:

- n = jumlah lapisan tanah yang akan dihitung besar pemampatan konsolidasi.

$Sc_i$  = besar pemampatan konsolidasi untuk lapisan ke-i

### 2.2.2 Pemampatan akibat Beban Bertahap

Sekali penimbunan tidak bisa langsung tinggi, karena akan ada pemanjangan tiembunan di tiap beberapa cm tiap satu minggu (**Gambar 2.1**). Maka dari itu, umur timbunan pada beberapa tahap akan berbeda-beda. Akibatnya efek beban dari timbunan pun akan berbeda.

**Gambar 2.1** Ilustrasi Penimbunan Bertahap

Besar pemampatan konsolidasi pada lapisan tanah lempung setebal H dapat dihitung dengan persamaan berikut

1. Apabila  $p'_o + \Delta p1 \leq pc$ :

$$Sc = \frac{C_s H}{1+e_0} \log \left( \frac{p'_o + \Delta p1}{p'_o} \right)$$

2. Apabila  $p'_o + \Delta p1 + \Delta p2 > pc$ :

$$Sc = \frac{C_s H}{1+e_0} \log \frac{p'_c}{p'_o + \Delta p1} + \frac{C_c H}{1+e_0} \log \left( \frac{p'_o + \Delta p1 + \Delta p2}{p'_c} \right)$$

3. Apabila  $p'_o + \Delta p1 + \Delta p2 + \Delta p3 > pc$ :

$$Sc = \frac{C_c H}{1+e_0} \log \left( \frac{p'_o + \Delta p1 + \Delta p2 + \Delta p3}{p'_o + \Delta p1 + \Delta p2} \right)$$

Keterangan:

$C_c$  = indeks pemampatan (*compression index*)

$C_s$  = indeks mengembang (*swelling index*)

$p'_o$  = Tegangan efektif *overburden*

$\Delta p$  = Penambahan tegangan akibat beban bertahap

$e_0$  = Angka pori tanah dasar

### 2.3 Peningkatan Kekuatan Tanah Dasar akibat Beban Luar

Kekuatan tanah dasar meningkat akibat adanya beban di atasnya. Beban di atasnya mengakibatkan suatu distribusi tegangan. Distribusi tegangan pun bervariasi sesuai dengan bentuk beban seperti, beban terpusat, beban garis, beban lingkaran, beban segi empat, beban trapesium.

$\Delta\sigma'$  merupakan tambahan tegangan akibat pengaruh beban timbunan (trapezium) yang ditinjau di tengah-tengah lapisan. Menurut Braja M. Das (1985), dalam bukunya “*Principles of Foundation Engineering, Second Edition*”, diagram tegangan tanah akibat timbunan dijelaskan **Gambar 2.2**. Besarnya  $\Delta\sigma'$  adalah:

$$\Delta\sigma' = \frac{q_0}{\pi} x \left[ \left( \frac{B_1+B_2}{B_2} \right) x (\alpha_1 + \alpha_2) - \left( \frac{B_1}{B_2} x \alpha_2 \right) \right]$$

[2.7]

keterangan:

$q_0$  = beban timbunan ( $t/m^2$ )  $\rightarrow q_0 = \gamma_{timb} \times h_{timb}$

$\Delta\sigma'$  = besarnya tegangan akibat pengaruh beban timbunan yang ditinjau di tengah-tengah lapisan ( $t/m^2$ )

$\alpha_1 = \tan^{-1} \left( \frac{B_1+B_2}{z} \right) - \tan^{-1} x \left( \frac{B_1}{z} \right)$  (radian)

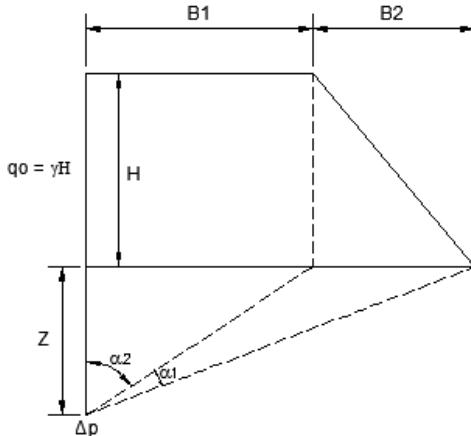

$\alpha_2 = \tan^{-1} x \left( \frac{B_1}{z} \right)$  (radian)

$B_1$  =  $\frac{1}{2}$  lebar timbunan

$B_2$  = panjang proyeksi horizontal kemiringan timbunan.

Nilai  $\Delta\sigma'$  yang diperoleh adalah untuk  $\frac{1}{2}$  bentuk timbunan sehingga untuk bentuk timbunan yang simetris, nilai  $q_0$  yang diperoleh harus dikali 2, dan berubah menjadi:

$$\Delta\sigma' = 2 \times q_0$$

**Gambar 2.2** Visualisasi dan Notasi  $\Delta P$

(sumber : *Principles of Foundation Engineering, Second Edition*)

## 2.4 Cara Menentukan Tinggi Timbunan Awal dan Waktu Preloading

### 2.4.1 Tinggi Timbunan Awal ( $H_{\text{initial}}$ )

Tinggi timbunan awal pada saat pelaksanaan tidak sama dengan tinggi timbunan rencana. Penentuan dari tinggi timbunan rencana pada saat pelaksanaan fisik (dengan memperhatikan adanya pemampatan), dapat dihitung dengan (Mochtar, 2012):

$$q_{\text{final}} = q = (H_{\text{inisial}} \times \gamma_{\text{timb}}) - (S_c \times \gamma_{\text{timb}}) + (S_c \times \gamma'_{\text{timb}})$$

$$q_{\text{final}} = q = (H_{\text{inisial}} - S_c)\gamma_{\text{timb}} + (S_c \times \gamma'_{\text{timb}})$$

$$H_{\text{inisial}} = \frac{q + (S_c \times \gamma_{\text{timb}}) - (S_c \times \gamma'_{\text{timb}})}{\gamma_{\text{timb}}}$$

$$H_{\text{akhir}} = H_{\text{inisial}} - S_c \text{ timbunan}$$

### 2.4.2 Kecepatan Waktu Konsolidasi

Pada umumnya tebal dari lapisan yang memampat dinyatakan sebagai  $H$  dan panjang terjauh dari aliran rembesan air disebut  $H_{\text{dr}}$ . Persamaan dari Terzaghi (1984), untuk menghitung waktu konsolidasi dari lapisan tanah yang memampat tersebut adalah:

$$t = \frac{Tv \cdot (H_{\text{dr}})^2}{Cv}$$

keterangan:

$Tv$  = faktor waktu

$t$  = waktu konsolidasi (detik)

$Cv$  = koefisien konsolidasi ( $\text{cm}^2/\text{det}$ )

$H_{\text{dr}}$  = panjang aliran air terpanjang

Untuk lapisan tanah yang dibatasi oleh 2 (dua) lapisan yang lolos air (*permeable*), misalnya pasir atau kerikil, panjang  $H_{\text{dr}} = \frac{1}{2} \times$  tebal lapisan. Akan tetapi, bila lapisan sebelah bawah berupa lapisan kedap air, maka aliran rembesan dianggap hanya dapat menuju ke atas lapisan, sehingga  $H_{\text{dr}} = H$ .

Untuk konsolidasi tanah yang berlapis-lapis dengan ketebalan berbeda, waktu konsolidasi dapat dicari dengan menggunakan rumus sebagai berikut (Mochtar, 2012):

$$Cv = \frac{(H_1 + H_2 + \dots + H_n)^2}{\left( \frac{H_1}{\sqrt{Cv_1}} + \frac{H_2}{\sqrt{Cv_2}} + \dots + \frac{H_n}{\sqrt{Cv_n}} \right)^2}$$

keterangan:

$H_1, H_2, \dots, H_n$  = tebal lapisan-lapisan tanah lempung yang mengalami pemampatan.

$Cv_1, Cv_2, \dots, Cv_n$  = nilai Cv untuk masing-masing lapisan tanah yang bersangkutan.

**Tabel 2.2 Variasi Faktor Waktu Terhadap Derajat Konsolidasi**

| Derajat Konsolidasi U% | Faktor Waktu Tv |
|------------------------|-----------------|
| 0                      | 0               |
| 10                     | 0,008           |
| 20                     | 0,031           |
| 30                     | 0,071           |
| 40                     | 0,126           |
| 50                     | 0,197           |
| 60                     | 0,287           |
| 70                     | 0,403           |
| 80                     | 0,567           |
| 90                     | 0,848           |
| 100                    | -               |

(sumber: Braja M. Das, 1985)

## 2.5 Perhitungan Stabilitas Timbunan

### 2.5.1 Perhitungan dengan Rumus

Penentuan tinggi timbunan yang diizinkan dapat ditentukan dengan perhitungan menggunakan rumus,

$$Hcr = \frac{c \cdot Nc}{\gamma}$$

keterangan:

- Hcr = tinggi timbunan kritis
- c = kekuatan geser *undrained*
- Nc = koefisien
- $\gamma$  = massa jenis tanah timbunan

Apabila tinggi rencana timbunan melebihi tinggi timbunan kritis, maka lereng tidak akan stabil atau butuh perkuatan.

### 2.5.2 Perhitungan dengan Software

Stabilitas timbunan dapat dihitung dengan menggunakan program *XSTABL* untuk menganalisa *overall stability*. Adapun data yang dibutuhkan meliputi, data tanah dasar, data tanah timbunan.

## 2.6 Metode Percepatan Pemampatan Tanah dengan *Vertical Drain*

Lamanya waktu konsolidasi disebabkan oleh lapisan tanah lunak yang tebal sehingga menyebabkan lamanya proses keluaran air pori secara vertikal. Untuk mempercepat proses konsolidasi maka diperlukan suatu metode *vertical drain*. Penerapan metode *vertical drain* yang akan digunakan yaitu dengan *Prefabricated Vertical Drain (PVD)*.

Penentuan waktu konsolidasi didasarkan teori aliran pasir vertikal menurut Barron (1948), menggunakan asumsi teori

Terzaghi tentang konsolidasi linier satu dimensi. Penentuan waktu konsolidasi dari teori Barron (1948) adalah :

$$t = \left( \frac{D^2}{8Ch} \right) F(n) \ln \left( \frac{1}{1 - \bar{U}h} \right)$$

keterangan:

$t$  = waktu untuk menyelesaikan konsolidasi primer

$D$  = diameter *equivalen* dari lingkaran tanah yang merupakan daerah pengaruh PVD

Nilai  $D = 1,13 \times s$  untuk pola susunan bujur sangkar

### (Gambar 2.3)

Nilai  $D = 1,05 \times s$  untuk pola susunan segitiga (Gambar 2.4)

$Ch$  = koefisien konsolidasi tanah horisontal  
 $= (kh/kv) \cdot Cv$

[2.15]

$Kh/kv$  = perbandingan antara koefisien permeabilitas tanah dasar arah horizontal dan vertikal, untuk tanah lempung yang jenuh air, nilai  $(kh/kv)$  berkisar antara 2 sampai 5. (sumber : Mochtar, 2000)

$F(n)$  = faktor hambatan yang disebabkan karena jarak antara PVD. Hansbo (1979) dalam Mochtar (2000) nilai  $F(n)$  didefinisikan sebagai berikut :

$$F(n) = \left( \frac{n^2}{n^2 - 1^2} \right) \left[ \ln(n) - \left( \frac{3n^2 - 1}{4n^2} \right) \right]$$

[2.16]

Atau :

$$F(n) = \left( \frac{n^2}{n^2 - 1^2} \right) \left[ \ln(n) - 3/4 - \left( \frac{1}{4n^2} \right) \right] \quad [2.17]$$

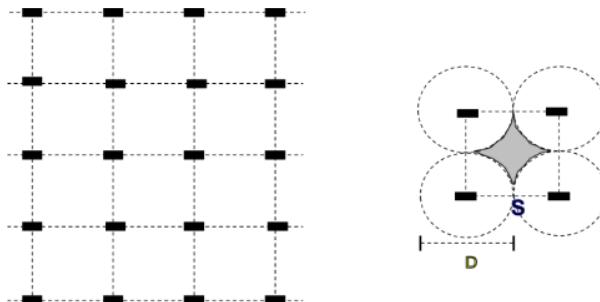

Pada umumnya  $n > 20$  sehingga dapat dianggap

$$1/n = 0 \text{ dan } \left( \frac{n^2}{n^2 - 1^2} \right) \approx 1$$

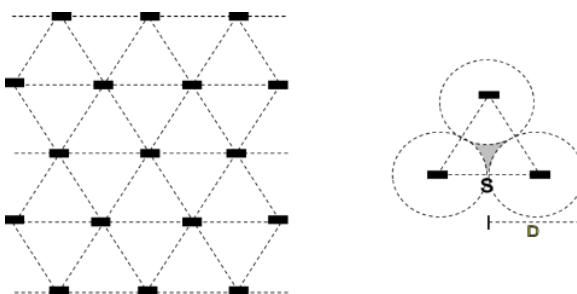

Jadi :

$$F(n) = \ln(n) - 3/4 \quad [2.18]$$

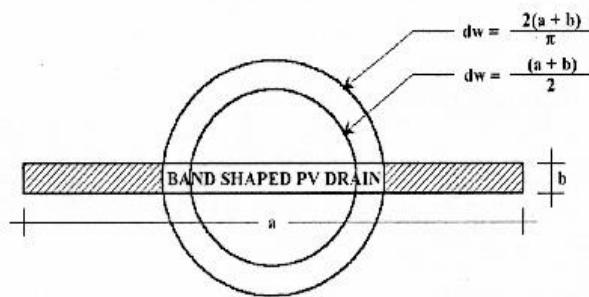

$$F(n) = \ln(D/dw) - 3/4 \quad [2.19]$$

**Gambar 2.3** Pola Susunan PVD Bujur Sangkar  
(sumber : Mochtar, 2000)

**Gambar 2.4** Pola Susunan PVD Segitiga  
(sumber : Mochtar, 2000)

**Gambar 2.5** Equivalen Diameter (dw) untuk PVD  
(sumber : Mochtar, 2000)

Hansbo (1979) menentukan waktu konsolidasi dengan menggunakan persamaan berikut :

$$t = \left( \frac{D^2}{8.Ch} \right) \cdot (2.F(n)) \cdot \ln \left( \frac{1}{1 - \bar{U}h} \right)$$

[2.20]

keterangan:

t = waktu yang diperlukan untuk mencapai Uh

- D = diameter lingkaran  
 F(n) = faktor hambatan disebabkan karena jarak PVD  
 Ch = koefisien konsolidasi tanah horisontal  
 Uh = derajat konsolidasi tanah (arah horisontal)

Dengan memasukkan nilai t tertentu, dapat dicari nilai Uh pada lapisan tanah yang dipasang PVD. Selain konsolidasi akibat aliran pori arah horisontal juga terjadi konsolidasi akibat aliran air arah vertikal Uv. Nilai Uv dicari dengan persamaan :

- Untuk  $Uv > 60\%$  :

$$Uv = (100 - 10^a)$$

$$a = \frac{1.781 - T_v}{0.933} \quad [2.21]$$

- Untuk  $Uv$  antara 0 s/d 60% :

$$Uv = \left( 2 \sqrt{\frac{tv}{\pi}} \right) \times 100\% \quad [2.23]$$

- Derajat konsolidasi rata-rata U dapat dicari dengan cara :

$$U = [1 - (1 - Uh)(1 - Uv)] \times 100\% \quad [2.24]$$

PVD tidak harus dipancang sampai lapisan tanah mampu mampat terbawah. Pengurangan penggunaan PVD dapat mengurangi biaya material, namun sisa lapisan tanah yang mampu mampat tersebut akan terus memampat dengan lama selayaknya tanpa PVD. Adapun syarat untuk membuat konstruksi di atas tanah tidak rusak akibat sisa pemampatan, yaitu 2.5 cm/tahun.

## 2.7 Kenaikan Daya Dukung Tanah

Sebagai akibat terjadinya konsolidasi pada suatu lapisan tanah, maka lapisan yang bersangkutan menjadi lebih padat yang

berarti kekuatan tanah juga meningkat sebagai akibat kenaikan nilai Cu (*undrained shear strength*).

Kenaikan daya dukung akibat beban timbunan sebesar  $\Delta P$ , adalah :

1. Tegangan tanah mula-mula (tegangan *overburden*) =  $p'_o$
2. Penambahan tegangan beban  $\Delta P$ , apabila periode pemberian beban  $t_1$  dan derajat konsolidasi =  $U_1$ , maka :

$$\Delta P_{u1} = \left( \frac{\sigma'_{t1}}{p'_o} \right)^{u1} p'_o - p'_o$$

[2.25]

3. Jadi tegangan tanah di lapisan yang di tinjau menjadi :

$$\sigma'_{\text{baru}} = p'_o + \left[ \left( \frac{\sigma'_{t1}}{p'_o} \right)^{u1} p'_o - p'_o \right]$$

[2.26]

4. Nilai Cu baru dari tanah pada saat  $t = t_1$  adalah :

- a. Untuk nilai *Plasticity Index* (PI) < 120%

$$\text{Cu (kg/cm}^2\text{)} = [ 0,0737 + (0,1899 - 0,0016 \text{ PI}) ] \sigma'_{\text{baru}}$$

[2.27]

- b. Untuk nilai *Plasticity Index* (PI)  $\geq 120\%$

$$\text{Cu (kg/cm}^2\text{)} = [ 0,0737 + (0,0454 - 0,00004 \text{ PI}) ] \sigma'_{\text{baru}}$$

[2.28]

## 2.8 Metode Perkuatan Tanah dengan *Geotextile*

### 2.8.1 Perencanaan Timbunan dengan Perkuatan *Geotextile*

Perencanaan *geotextile* tergantung pada besar peningkatan momen perlawanan ( $\Delta M_R$ ) yang direncanakan. Perhitungan untuk mencari ( $\Delta M_R$ ) dapat menggunakan persamaan berikut:

$$\Delta M_R = (M_D \times SF) - M_R$$

[2.29]

keterangan:

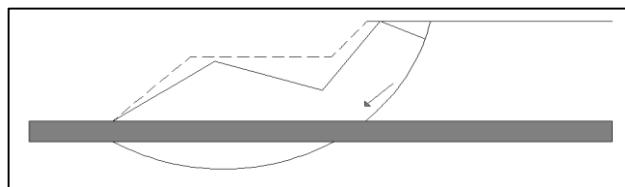

$M_R$                = momen penahan

$$\Delta M_R = \text{momen penahan tambahan yang harus dipikul oleh geotextile}$$

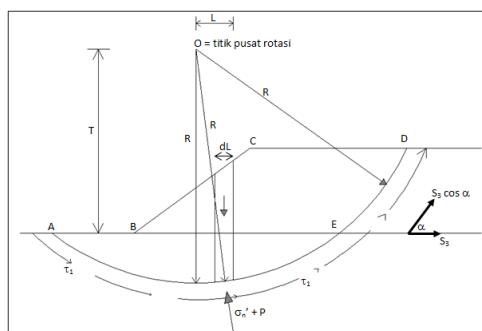

$$M_D = \text{momen dorong, } \frac{MR}{SF}$$

### 2.8.2 Overall Stability

Untuk menganalisa angka keamanan dari *overall stability* dapat menggunakan model irisan Bishop (1955) dengan bantuan Program *Geoslope*. Gaya-Gaya yang bekerja pada *overall stability* juga sesuai dengan yang digambarkan pada **Gambar 2.8** dan **Gambar 2.9**.

**Gambar 2.6** Model Kelongsoran untuk *Overall Stability*  
(Sumber: Mochtar, 2000)

**Gambar 2.7** Gaya-Gaya yang Bekerja untuk *Overall Stability*  
(Sumber: Mochtar, 2000)

$$\begin{aligned}
 T &= \text{jarak vertikal titik pusat rotasi dengan geotextile} \\
 &\quad \text{yang ditinjau} \\
 &= yo - yc
 \end{aligned}
 \tag{2.30}$$

keterangan:

$$\begin{aligned}
 yo &= \text{ordinat titik pusat rotasi} \\
 yc &= \text{ordinat titik yang ditinjau} \\
 \tau &= \text{tegangan geser geotextile dengan tanah asli} \\
 &= Cu + \sigma v \tan \theta
 \end{aligned}
 \tag{2.31}$$

$$\begin{aligned}
 Cu &= \text{tegangan geser tanah asli} \\
 \sigma v &= \text{tegangan vertikal timbunan} \\
 \theta &= \text{tegangan geser tanah}
 \end{aligned}$$

Adapun syarat dari *overall stability* yang harus dipenuhi adalah sebagai berikut:

$$\begin{aligned}
 M_R &= (M_D \times SF) + \Delta M_R \\
 SF &= \frac{M_R - \Delta M_R}{M_D}
 \end{aligned}$$

keterangan:

$$\begin{aligned}
 M_D &= \text{Momen penggerak} = (\text{berat segmen busur ABCDEA}) \times \text{jarak pusat berat ABCDEA terhadap O.}
 \end{aligned}$$

$$M_R = \text{Momen penahanan}$$

$$\Delta M_R = \text{Momen penahan tambahan yang ditahan oleh geotextile } SF_{\min} \text{ yang digunakan mengacu pada Tabel 2.3 dan Tabel 2.4}$$

**Tabel 2.3 Safety Factor untuk Slope Baru** (diadaptasi dari GEO, 1984)

| Economic risk | Required factor of safety with loss of life<br>for a 10 years return period rainfall |     |      |
|---------------|--|-----|------|
|               | Negligible   | Low | High |
| Negligible    | >1.1   | 1.2 | 1.4  |
| Low           | 1.2  | 1.3 | 1.5  |
| High          | 1.4  | 1.5 | 1.6  |

(Sumber : Burt Look, 2007)

**Tabel 2.4** Resiko Keselamatan (diadaptasi dari GEO, 1984)

| Situation  | Risk to life |
|--|--------------|
| Open farmland  | Negligible   |
| Country parks, lightly used recreation areas   | Negligible   |
| Country roads and low traffic intensity B roads  | Negligible   |
| Storage compounds (non hazardous goods)  | Negligible   |
| Town squares, sitting out areas, playgrounds and car parks   | Negligible   |
| High traffic density B roads   | Low          |
| Public waiting areas (e.g. railway stations, bus stops)  | Low          |
| Occupied buildings (residential, commercial, industrial and educational)                                   | High         |
| All A roads, by-passes and motorways, including associated slip roads, petrol stations and service areas   | High         |
| Buildings storing hazardous goods, power stations (all types), nuclear, chemical, and biological complexes | High         |

(Sumber : Burt Look, 2007)

Maka digunakan,  $SF_{min} \geq 1,5$  (beban tetap) ;  $SF_{min} \geq 1,2$  (beban sementara).

Syarat kekuatan bahan  $S_1$

$$T_{allow} = \frac{T_{ultimate}}{SF} \quad [2.32]$$

$T_{allow}$  = Kekuatan tarik *geotextile* ( $\text{kN}/\text{m}^2$ )

$T_{ultimate}$  = Kekuatan tarik bahan *geotextile* ( $\text{kN}/\text{m}^2$ )

$SF$  =  $SF_{ID} \times SF_{CR} \times SF_{CD} \times SF_{BD}$

$SF_{ID}$  = angka keamanan intuk kesalahan pemasangan (*installation damage*)

$SF_{CR}$  = angka keamanan untuk *creep*

$SF_{CD}$  = angka keamanan untuk *chemical degradation*

$SF_{BD}$  = angka keamanan untuk *biological degradation*.

Panjang *Geotextile* di belakang bidang lonsor ( $L_e$ ) dihitung menggunakan persamaan berikut:

$$L_e = (T_{allow} \times SF) / [(\tau_1 + \tau_2) \times E]$$

[2.33]

$$E = \text{efisiensi, diambil } E = 0,8$$

Besar Momen penahan *geotextile* dapat dihitung menggunakan persamaan berikut:

$$M_{geotextile} = T_{allow} \times T_i$$

[2.34]

keterangan:

$$T_{allow} = \text{Kekuatan tarik } geotextile \text{ (kN/m}^2\text{)}$$

$$T_i = \text{Jarak vertikal antara } geotextile \text{ dengan pusat bidang longsor (m)}$$

Panjang *Geotextile* yang ditanam (L) :

$$L = L_e + L_R$$

[2.35]

$$L_e = \text{panjang geotextile yang berada dalam anchorage zone (min} = 3 \text{ ft / 1.0m)}$$

$$L_R = \text{panjang geotextile yang berada di depan bidang longsor}$$

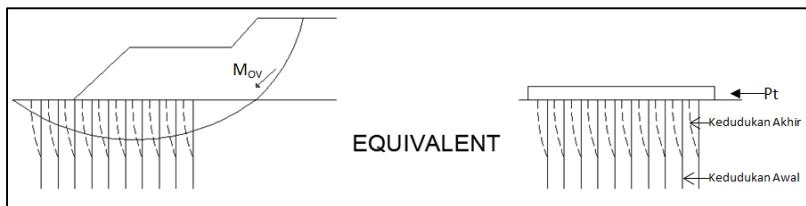

$$[2.36] \quad L_R = (H - Z) \times \left[ \operatorname{tg} \left( 45^\circ - \frac{\phi}{2} \right) \right]$$

$$[2.37] \quad L_e = \frac{S_v \cdot \sigma_h \cdot SF}{2[c + \sigma_v (\operatorname{tg} \delta)]}$$

$$[2.38] \quad L_o = \frac{S_v \cdot \sigma_h \cdot SF}{4[c + \sigma_v (\operatorname{tg} \delta)]}$$

## 2.9 Metode Perkuatan Tanah dengan Cerucuk

Asumsi yang dipakai untuk perhitungan *micropile* ini adalah asumsi cerucuk oleh Mochtar (2012). Penggunaan cerucuk dimaksudkan untuk menaikkan tahanan geser tanah. Bila tahanan tanah terhadap geser meningkat, maka daya dukung tanah pun meningkat. Asumsi yang digunakan dalam konstruksi cerucuk dapat dilihat pada **Gambar 2.8**.

**Gambar 2.8** Asumsi Gaya yang Diterima Cerucuk

(Sumber: Mochtar, 2012)

Adapun prosedur dari perhitungan kebutuhan cerucuk berdasarkan NAVFAC DM-7 (1971) adalah sebagai berikut:

a. Menghitung kekuatan 1 (satu) buah cerucuk terhadap gaya horizontal.

- Menghitung faktor kekuatan relatif (T)

$$T = \left( \frac{EI}{f} \right)^{\frac{1}{5}}$$

keterangan:

E = Modulus elastisitas tiang (cerucuk),

Kg/cm<sup>2</sup>

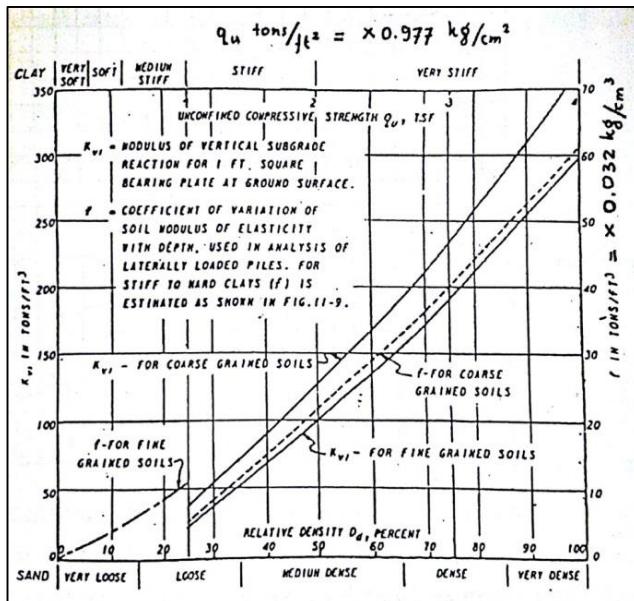

I = Momen inersia tiang (cerucuk), cm<sup>4</sup>

f = koefisien dari variasi modulus tanah,

kg/cm<sup>3</sup>

T = faktor kekakuan relatif, cm

Nilai f dengan bantuan **Gambar 2.9** yang merupakan grafik antara f dengan *unconfined compression strength*, yaitu  $q_u = 2.C_u$

**Gambar 2.9** Nilai  $f$  untuk Berbagai Jenis Tanah  
(Sumber: *Design Manual*, NAVFAC DM-7, 1971)

Menghitung gaya horizontal yang mampu ditahan 1 tiang.

$$M_p = F_M \times (P \times T)$$

keterangan:

$M_p$  = momen lentur yang mampu ditahan oleh cerucuk akibat beban horizontal  $P$ , Kg.com.

$F_M$  = koefisien momen akibat gaya lateral  $P$ .

$P$  = gaya horizontal maksimum yang mampu diterima oleh satu cerucuk, Kg.

$T$  = faktor kekakuan relatif, cm.

Dengan merencanakan panjang cerucuk yang tertahan di bawah/atasi bidang gelincir ( $L$ ) didapat nilai  $L/T$  dengan grafik **Gambar 2.10** dan nilai  $L/T$  pada kedalaman  $z$  didapat nilai  $F_M$ .

Jadi, gaya horizontal yang mampu dipikul oleh 1 (satu) cerucuk adalah:

$$P = \frac{M_p}{F_M \times T}$$

Gaya maksimal  $P_{\max}$  yang dapat ditahan oleh 1 cerucuk terjadi bila  $M_p$  = momen maksimal lentur bahan cerucuk. Bila kekuatan bahan dan dimensi bahan diketahui, maka:

$$M_p \max 1 \text{ cerucuk} = \frac{\sigma_{\max \text{ bahan}} \times I_n}{C}$$

$$\text{atau } M_p \max 1 \text{ cerucuk} = \sigma_{\max} \times W$$

keterangan:

$$\sigma_{\max} = \text{tegangan tarik/tekan maks. bahan cerucuk}$$

$$L = \text{momen inersia penampang cerucuk terhadap garis yang melewati titik pusat penampang}$$

$$C = \frac{1}{2} \times D, D = \text{diamater cerucuk}$$

$$W = I_n/C$$

sehingga:

$$P_{\max 1 \text{ cerucuk}} = \frac{M_p \max 1 \text{ cerucuk}}{F_M \times T} \times F_k$$

dengan  $F_k$  menurut Rusdiansyah & Mochtar (2015):

$$F_k = 2,30 \times Y_t \times Y_s \times Y_n \times Y_D$$

dengan syarat:

- Spasi cerucuk yang digunakan : 3D sampai 8D

- Rasio tancap yang digunakan :  $L/D = 5$  s.d.  $L/D = 20$

Untuk nilai  $L/D < 5$  maka digunakan persamaan  $Y_t=0,02$  ( $X_t$ ). Sedangkan untuk nilai  $L/D > 20$  maka digunakan nilai  $Y_t \leq 1,45$ .

- Rasio  $D/T$  yang digunakan : 0,099 s.d. 0,113

(  $Y_D=1$  jika  $D/T = 0,1$  )

(  $Y_{D \min}=1$ ;  $Y_{D \max}=2$  )

dimana:

$F_k$  = faktor koreksi gabungan

$Y_t$  = persamaan pengaruh rasio tancap cerucuk

$X_t$  = rasio tancap ( $L/D$ )

$Y_D$  = persamaan pengaruh diameter cerucuk

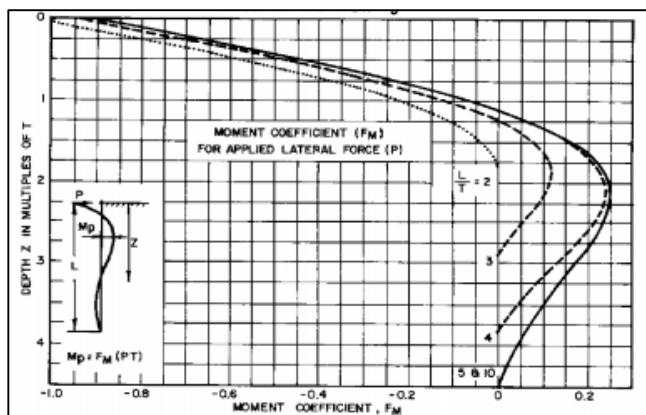

$X_D$  = rasio ( $D/T$ )

$Y_S$  = persamaan pengaruh spasi/jarak antar cerucuk

$X_S$  = spasi ( $S/D$ )

$Y_n$  = persamaan pengaruh jumlah cerucuk

$X_n$  = jumlah cerucuk

**Gambar 2.10** Grafik untuk Mencari Nilai  $F_M$   
(Sumber: Design Manual, NAVFAC DM-7, 1971)

- b. Untuk menghitung banyaknya tiang atau cerucuk per meter, maka ditentukan gaya horizontal total yang terjadi pada bidang gelincir ( $P_t$ ).

$$SF_{yang\ diinginkan} = \frac{Momen\ Penahan\ (M_R)}{Momen\ Penggerak\ (M_D)}$$

keterangan:

$$\begin{aligned} SF_{yang\ diinginkan} &= Safety\ Factor\ yang\ hendak\ dicapai \\ M_R &= \sum Cu_i \times L_i \times R_i = M_R\ dari\ tanah + \end{aligned}$$

$\Delta M_R$  dari cerucuk

$$\begin{aligned} Cu &= Tegangan\ geser\ undrained \\ tanah\ dasar & \end{aligned}$$

$$L = Panjang\ bidang\ gelincir$$

$$R = \text{Jari-jari putar bidang gelincir}$$

$$M_R = M_R \text{ dari tanah} + \Delta M_R \text{ dari cerucuk}$$

keterangan:

$$M_R = SF \text{ yang diinginkan} \times M_D$$

$$M_R \text{ dari tanah} = SF \text{ yang ada} \times M_D$$

Maka:

$$(SF \text{ yang diinginkan} \times M_D) = (SF \text{ yang ada} \times M_D) + \Delta M_R \text{ dari cerucuk}$$

$$\Delta M_R \text{ dari cerucuk} = (SF \text{ yang diinginkan} - SF \text{ yang ada}) \times M_D$$

Tambahan  $\Delta M_R$  tersebut merupakan tambahan momen penahan yang ditimbulkan oleh adanya cerucuk, sehingga jumlah cerucuk yang dibutuhkan ( $n$ ), adalah:

$$n \times P_{\max 1 \text{ cerucuk}} \times R = (SF \text{ yang diinginkan} - SF \text{ yang ada}) \times M_D$$

$$n = \frac{(SF \text{ yang diinginkan} - SF \text{ yang ada}) \times M_D}{P_{\max 1 \text{ cerucuk}} \times R}$$

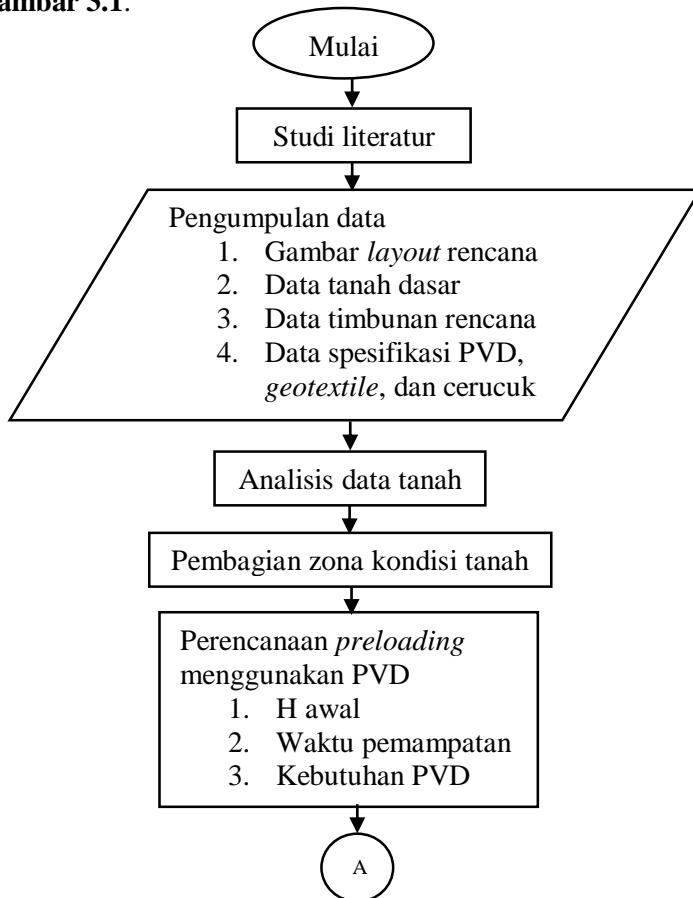

“Halaman ini sengaja dikosongkan”

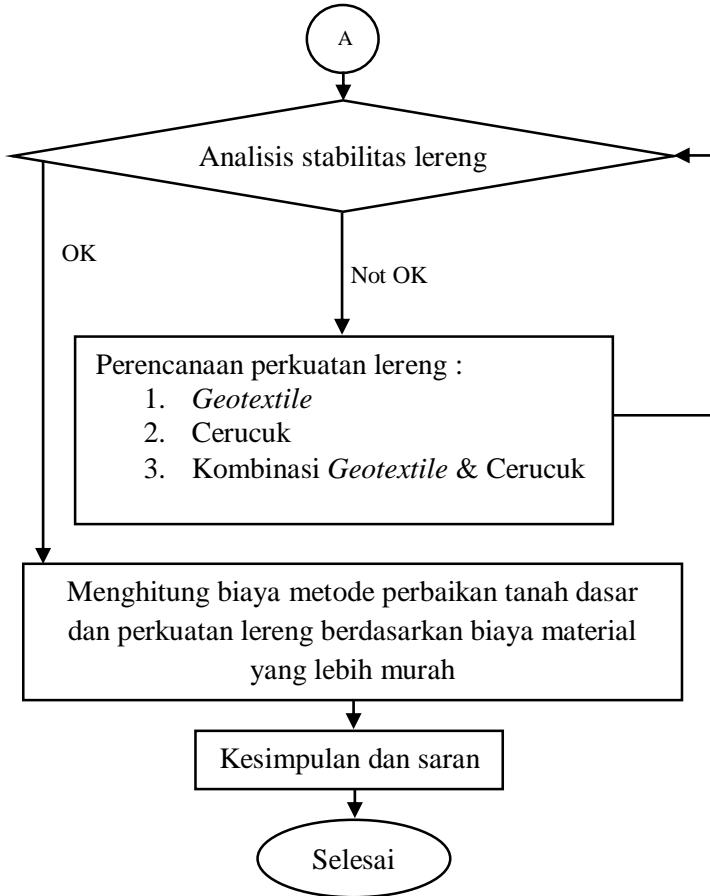

## BAB III

### METODOLOGI

#### 3.1 Bagan Alir

Berikut ini adalah diagram alir untuk proses penggerjaan tugas akhir dalam perencanaan perbaikan tanah dasar dan kestabilan lereng timbunan pada Jalan Tol Terbanggi Besar – Pematang Panggang, Provinsi Lampung yang ditunjukkan pada **Gambar 3.1.**

**Gambar 3.1** Diagram Alir Tugas Akhir

### 3.2 Uraian Tahapan Perencanaan

#### 3.2.1 Studi Literatur

Studi literatur berupa pengumpulan materi-materi yang akan digunakan sebagai acuan perencanaan perbaikan tanah dasar dan perkuatan lereng timbunan. Adapun bahan studi yang akan digunakan dalam perencanaan adalah sebagai berikut:

1. Perencanaan *prefabricated vertical drain (PVD)* sebagai perbaikan tanah dasar
2. Perhitungan kedalaman dan jarak PVD
3. Referensi mengenai perhitungan stabilitas lereng timbunan
4. Referensi tentang software *XSTABL*
5. Perhitungan perencanaan *geotextile* sebagai metode perkuatan lereng timbunan
6. Perhitungan perencanaan cerucuk sebagai metode perkuatan lereng timbunan
7. Perhitungan perencanaan kombinasi *geotextile* & cerucuk sebagai metode perkuatan lereng timbunan

### **3.2.2 Pengumpulan Data**

Data yang digunakan adalah data sekunder.

1. Gambar *layout* rencana proyek
2. Data tanah dasar
3. Data timbunan rencana
4. Data spesifikasi PVD
5. Data spesifikasi *geotextile*
6. Data spesifikasi cerucuk (*micropile*)

### **3.2.3 Analisa Data Tanah**

Data tanah yang ada dianalisa untuk mengetahui jenis tanah dan kedalaman tanah mudah mampat (*compressible*).

### **3.2.4 Pembagian Zona Kondisi Tanah**

Berdasarkan data tanah yang didapat dibuat pembagian zona dan dilakukan pengecekan di tiap 50 meter.

### **3.2.5 Perhitungan Perbaikan Tanah Dasar**

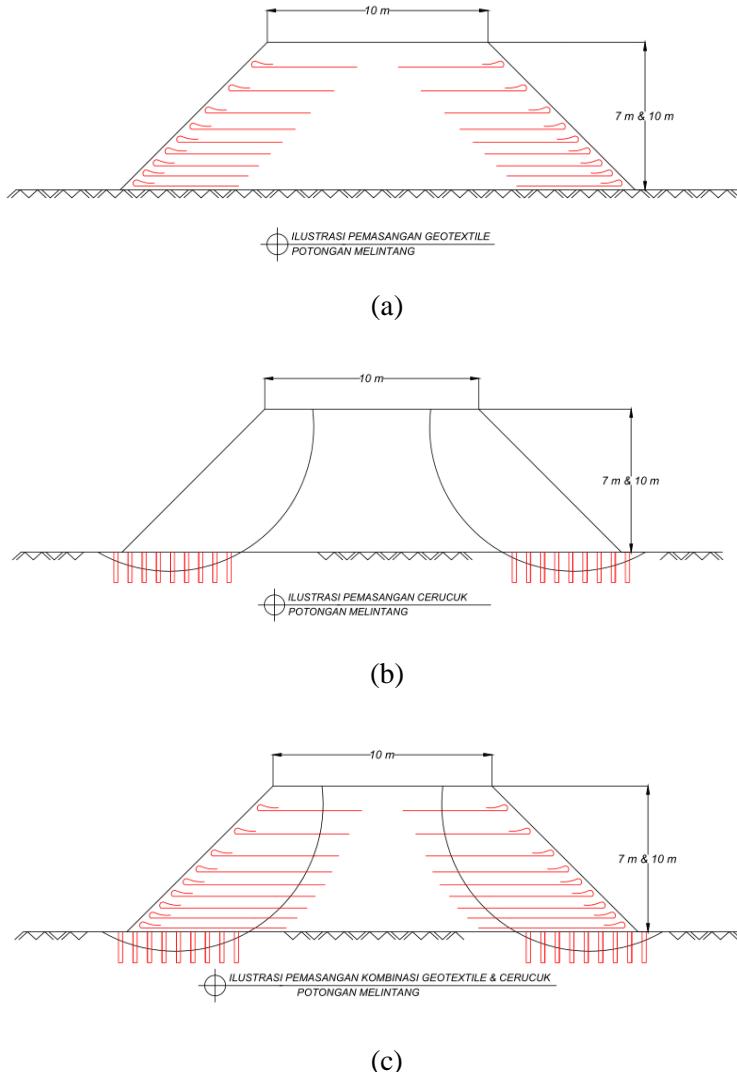

Perencanaan perbaikan tanah dasar dengan metode berikut:

- a. Perbaikan Tanah Dasar dengan sistem *preloading* dikombinasikan dengan *prefabricated vertical drain (PVD)*
  - Menghitung angka peningkatan daya dukung jika menggunakan sistem *preloading*
  - Menghitung kebutuhan dan jarak *PVD*
  - Menghitung kedalaman *PVD*

### 3.2.6 Perhitungan Perkuatan Lereng Timbunan

Perencanaan perkuatan dengan alternatif berikut (ilustrasi pada **Gambar 3.2**):

- a. Perkuatan lereng dengan *geotextile*
  - Menentukan tipe *geotextile*
  - Merencanakan jarak antar *geotextile*
  - Menghitung panjang dan banyak *geotextile* yang dibutuhkan
- b. Perkuatan lereng dengan cerucuk
  - Merencanakan jumlah cerucuk yang dibutuhkan
  - Menghitung panjang cerucuk yang dibutuhkan
  - Menentukan jarak pemasangan cerucuk
- c. Perkuatan lereng dengan kombinasi *geotextile* & cerucuk
  - Merencanakan jumlah *geotextile* & cerucuk yang dibutuhkan
  - Menghitung panjang *geotextile* & cerucuk yang dibutuhkan
  - Menentukan jarak pemasangan *geotextile* & cerucuk

**Gambar 3.2 Ilustrasi Pemasangan (a) Geotextile, (b) Cerucuk, (c)  
Kombinasi Geotextile & Cerucuk**

### **3.2.7 Perhitungan Biaya Material**

Menghitung biaya metode perbaikan tanah dasar dan membandingkan biaya metode perkuatan lereng timbunan berdasar biaya material paling murah.

### **3.2.8 Kesimpulan dan Saran**

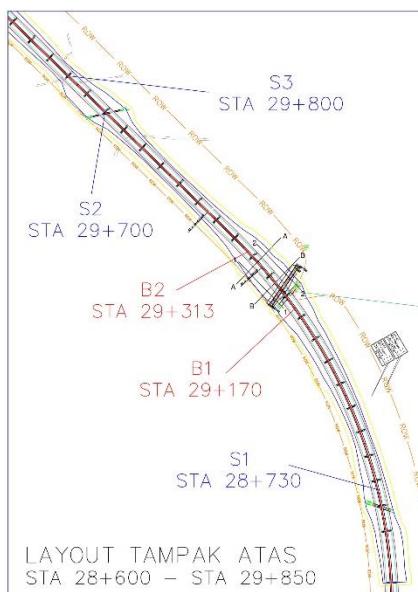

Pada kesimpulan dipaparkan rencana perbaikan tanah dasar dan perkuatan lereng timbunan mana yang akan dipakai beserta alasan pertimbangan pemilihan. Pada saran dituliskan saran dan harapan atas perencanaan perbaikan tanah dasar dan perkuatan lereng timbunan pada Jalan Tol Terbanggi Besar – Pematang Panggang, Provinsi Lampung demi peningkatan kualitas perencanaan selanjutnya.

## BAB IV

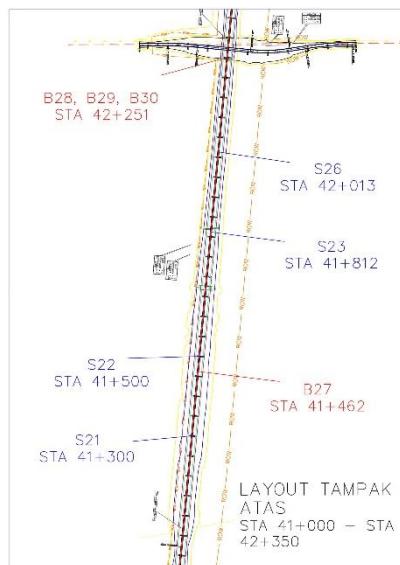

### DATA DAN ANALISA

#### 4.1 Data Tanah

Data tanah yang tersedia pada lokasi proyek merupakan penyelidikan yang dilakukan oleh Geocon Reka Cipta pada tahun 2017. *Section* pertama yaitu STA 28+600 – STA 29+850 atau nantinya bakal disebut *Section* 28 memiliki 2 titik bor dan 3 titik sondir, lalu *section* kedua yaitu *Section* 41 pada STA 41+000 – STA 42+350 memiliki 4 titik bor dan 4 titik sondir. Pada data SPT (Standard Penetration Test) dengan kedalaman maksimal 24 m pengambilan sampel dilakukan pada setiap kedalaman -3m, -7m, -11m, -15m, -19m, -23m dan SPT diambil setiap interval 2 meter. Titik bor dan sondir letaknya sesuai pada **Gambar 4.1** dan dirangkum pada **Tabel 4.1**. Data-data tersebut terlampir pada Lampiran 1.

(b) *Section 41*

**Tabel 4.1** Lokasi Titik Sampel

| NO | TITIK | STA    |
|----|-------|--------|
| 1  | S1    | 28+730 |
| 2  | B1    | 29+170 |
| 3  | B2    | 29+313 |
| 4  | S2    | 29+700 |
| 5  | S3    | 29+800 |
| 6  | S21   | 41+300 |
| 7  | B27   | 41+462 |
| 8  | S22   | 41+500 |
| 9  | S23   | 41+812 |
| 10 | S26   | 42+013 |
| 11 | B28   | 42+251 |
| 12 | B29   | 42+251 |
| 13 | B30   | 42+251 |

Proses selanjutnya semua data tanah dianalisa dengan membandingkan jenis tanah, analisa SPT pada bor dan korelasi NSPT pada sondir, nilai tahanan conus dari sondir untuk mendapatkan konsistensi tanah, kedalaman tanah yang bisa memampat. Berdasarkan semua data bor dan sondir yang memiliki karakteristik sama akan dijadikan satu zona.

#### 4.1.1 Data Tanah Dasar

Hasil tes lab yang didapat dari titik bor sudah mencakup hampir keseluruhan data tanah, namun untuk sondir kita perlu melakukan analisa terlebih dahulu untuk mengerti parameter dalam data tanah. Contoh analisa sondir yang digunakan untuk pembagian zona dapat dilihat pada **Tabel 4.2**, untuk lebih lengkapnya terdapat pada Lampiran 1.

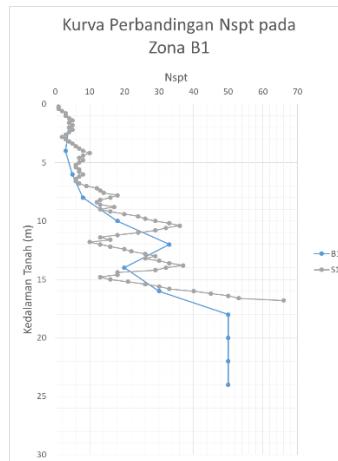

**Tabel 4.2** Analisa Data S1 STA 28+730

#### 4.1.2 Pembagian Zona Kondisi Tanah

Dasar dalam menentukan data tanah mana saja yang dapat dijadikan satu zona adalah dengan melihat *layout* jalan tol, dari sana dapat membantu kita menentukan apakah jarak antar data tanah cukup dekat hingga dapat dijadikan dalam satu kurva, atau adakah pembatas antar data tanah seperti sungai yang dapat membuat kecenderungan tanah yang begitu berbeda dari satu sisi ke sisi lainnya. Selanjutnya dengan membandingkan kedalaman tanah yang dapat memampat dari tiap masing masing data. Salah satu caranya adalah dengan melihat kurva NSPT dari bor dan kurva korelasi NSPT dari data tahanan konus sondir. Lalu cara menentukan pembagian zona yang terakhir yaitu dengan membandingkan jenis tanah dan konsistensinya.

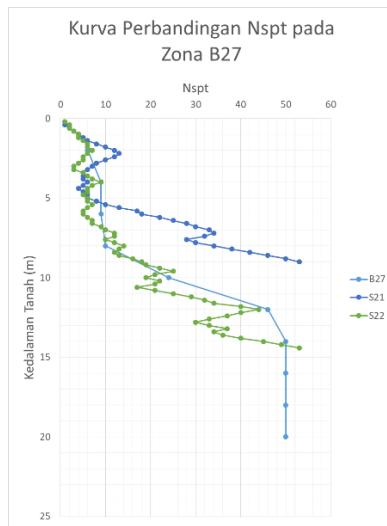

Pada gambar kurva berikut ini dapat kita lihat bahwa terdapat kesamaan karakteristik tanah hingga dapat dijadikan dalam satu zona. *Section* 28 nantinya akan dibagi menjadi 2 zona yaitu B1 dan B2, lalu *Section* 41 dibagi menjadi 2 zona juga yaitu B27 dan B30. Penjelasan mengenai pembagian zona akan dijabarkan lebih mendetail pada sub bab selanjutnya.

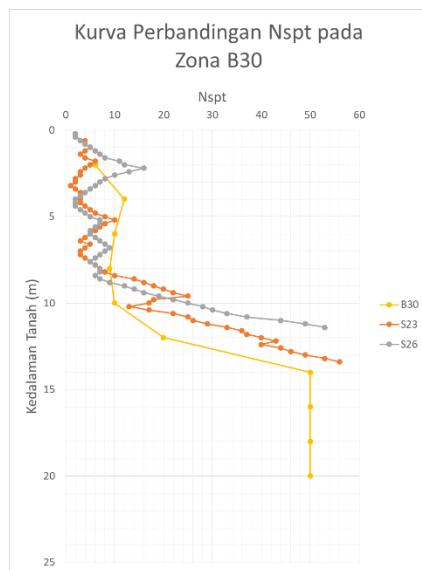

**Gambar 4.2** Kurva Perbandingan Nspt dan Korelasi Nspt pada Zona B1

**Gambar 4.3** Kurva Perbandingan N<sub>SPT</sub> dan Korelasi N<sub>SPT</sub> pada Zona B2

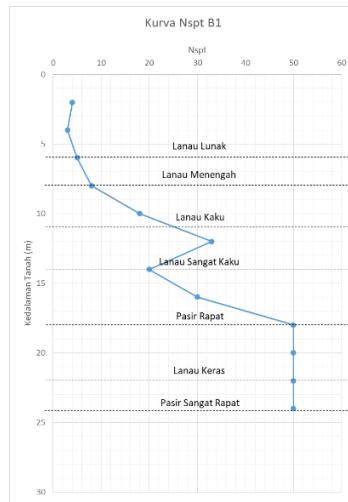

**Gambar 4.4** Kurva Perbandingan N<sub>SPT</sub> dan Korelasi N<sub>SPT</sub> pada Zona B27

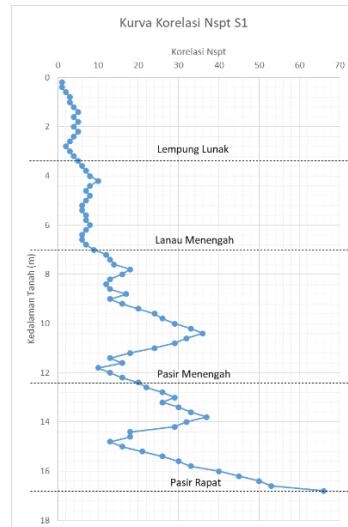

**Gambar 4.5** Kurva Perbandingan  $N_{SPT}$  dan Korelasi  $N_{SPT}$  pada Zona B30

#### 4.1.3 Section 28 Zona B1

Section 28 yang berada pada STA 28+600 – STA 29+850 dibagi menjadi 2 zona. Zona pertama yaitu zona B1 untuk STA 28+600 – STA 29+250. Zona ini terdiri dari B1 dan S1, kedua data tersebut digabung digabung menjadi satu zona dan dianggap sama karena memiliki kedalaman *compressible soil* yang sama, dan memiliki jenis dan konsistensi tanah yang mirip seperti terlihat pada **Gambar 4.6** dan **Gambar 4.7**. Namun nantinya untuk perhitungan pada zona ini akan merujuk pada data yang didapat dari B1 karena data bor mengambil sampel tanah dan diuji di laboratorium, oleh karenanya data tersebut lebih akurat dibanding data sondir yang harus menggunakan korelasi. Semua kurva dari masing-masing zona lebih jelasnya dapat dilihat di Lampiran 1.

**Gambar 4.6** Kurva Perbandingan N<sub>SPT</sub> dan Kedalaman Tanah pada B1

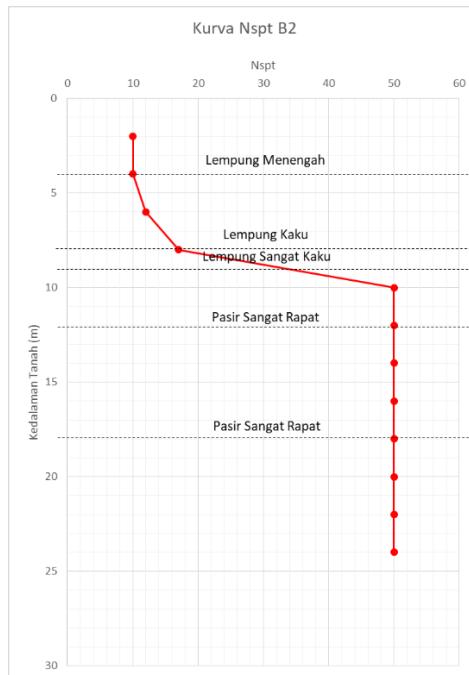

**Gambar 4.7** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S1

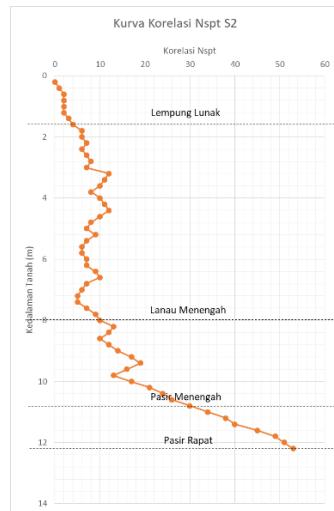

Kedua kurva B1 dan S1 dapat dilihat bahwa kedalaman *compressible soil* hampir sama yaitu pada kedalaman 7 meter. Konsistensi dan jenis tanah juga mirip yaitu lanau/lempung lunak lalu menengah.

#### 4.1.4 Section 28 Zona B2

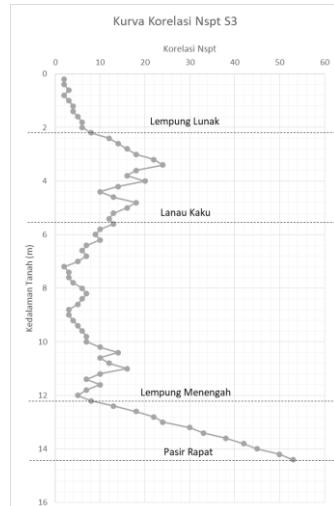

Zona berikutnya pada *section 28* yaitu zona B2 pada STA 28+300 – STA 29+850. Zona ini menggabungkan data dari B2, S2, dan S3. Pada gambar-gambar kurva berikut dapat membantu kita untuk menentukan kesamaan dari data tanah dalam satu zona.

**Gambar 4.8** Kurva Perbandingan N<sub>SPT</sub> dan Kedalaman Tanah pada B2

**Gambar 4.9** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S2

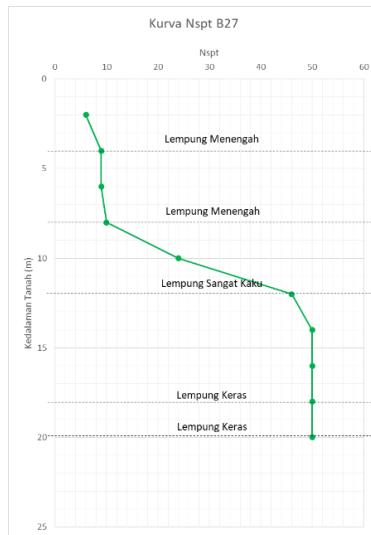

**Gambar 4.10** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S3

Data S2 dan B2 digabung dan dianggap sama dalam Zona B2 karena meskipun di tabel rekap S2 dan di gambar kurva korelasi  $N_{SPT}$  ditulis memiliki kedalaman *compressible soil* 8 meter namun apabila melihat lebih jelas dari kurva korelasi  $N_{SPT}$  oleh tahanan conus sondir, S2 pertama kali menyentuh  $N_{SPT}$  lebih dari 10 yaitu ketika berada di kedalaman 4 meter sama dengan kedalaman *compressible soil* milik B2. Area S3 tidak memiliki kesamaan kedalaman *compressible soil* maupun jenis dan konsistensi tanah dengan B2 maupun S2 namun diabaikan dan dianggap sama dengan B2 karena panjang jalan yang dicover oleh S3 pendek dan kedalaman *compressible soil* S3 lebih pendek daripada B2 maupun S2.

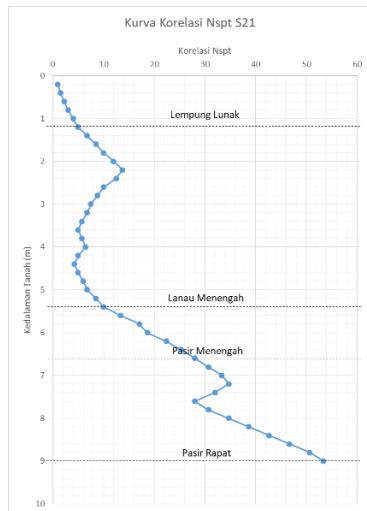

Walaupun zona B2 menggabungkan data dari B2, S2, dan S3, data tanah yang digunakan untuk perhitungan nanti akan merujuk pada data B2 karena data bor dianggap lebih akurat dibandingkan data sondir. Data bor mengambil sampel tanah dan melakukan uji tanah di laboratorium sedangkan data sondir hanya berdasarkan korelasi yang tingkat keakuratannya lebih kecil.

#### **4.1.5 Section 41 Zona B27**

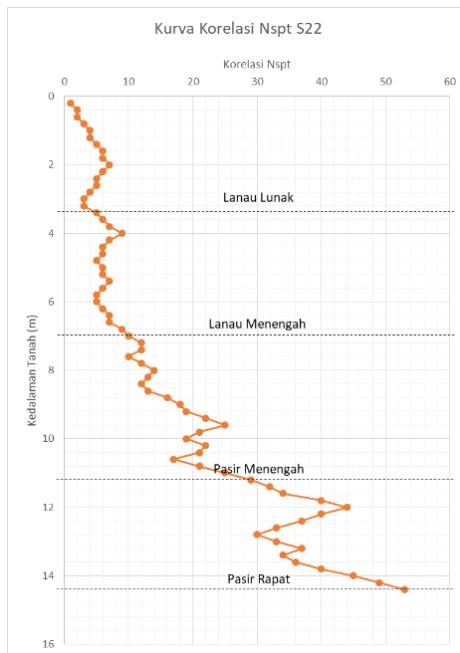

*Section 41* berada pada STA 41+000 – STA 42+350 akan dibagi menjadi 2 zona yaitu zona B27 dan zona B30. Kita akan membahas terlebih dahulu zona B27 yang mencakup STA 41+000 – STA 41+750. Zona ini terdiri dari data S21, S22, dan B27 sendiri. Kurva dari masing-masing data yang masuk dalam zona ini dapat dilihat pada gambar-gambar berikut.

**Gambar 4.11** Kurva Perbandingan  $N_{SPT}$  dan Kedalaman Tanah pada B27

**Gambar 4.12** Kurva Perbandingan Korelasi  $N_{SPT}$  dan Kedalaman Tanah pada S21

**Gambar 4.13** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S22

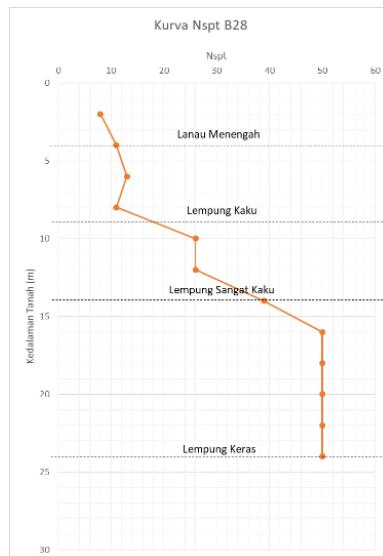

Berdasarkan kurva S21 dan S22 memiliki konsistensi dan jenis tanah yang sangat mirip, namun kedalaman *compressible soil* agak berbeda. S21 mencapai tanah keras pada kedalaman 5,4 meter dan S22 mencapai tanah keras pada kedalaman 7 meter. Untuk B27 sendiri memiliki kedalaman *compressible soil* 8 meter, namun jenis dan konsistensi tanah yang dimiliki berbeda dengan S21 dan S22.

Walaupun ketiga data tersebut tidak benar-benar mirip, kita tetap akan menjadikan dalam satu zona karena letak pengambilan data B27, S21, dan S22 cenderung berdekatan. Data B27 diambil pada STA 41+462, S21 pada STA 41+300 dan S22 diambil pada STA 41+500. Pada perhitungan nanti, data yang digunakan

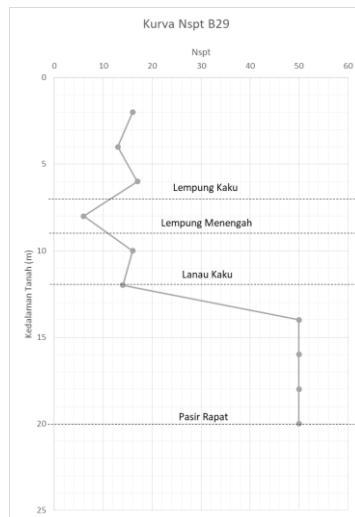

adalah data B27 karena data bor lebih akurat dibanding data sondir. Selain itu karena data B27 memiliki kedalaman *compressible soil* lebih dalam dibanding S21 dan S22, jadi bisa dikatakan lebih aman ketika kita mengasumsikan kondisi yang lebih jelek.

#### 4.1.6 Section 41 Zona B30

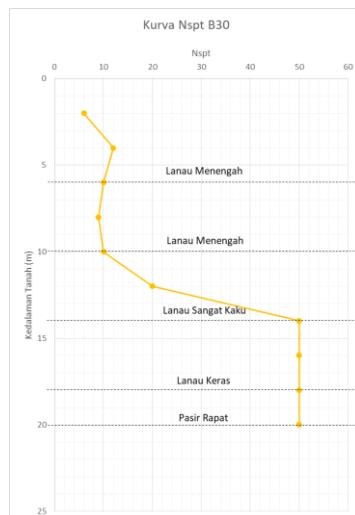

Zona selanjutnya pada section 41 adalah zona B30 yaitu pada STA 41+800 – STA 42+350. Pada zona ini terdapat data S23, S26, B28, B29, serta B30 yang dijadikan dalam satu zona. Untuk memudahkan pembagian dapat kita lihat kurva dari masing-masing data pada gambar berikut ini.

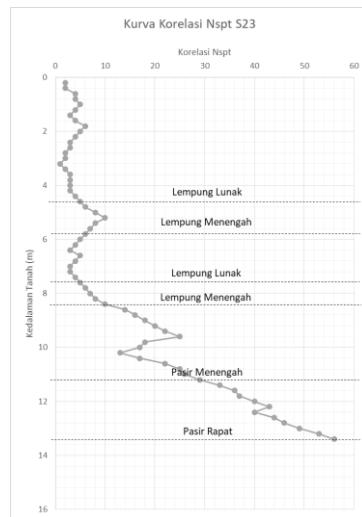

**Gambar 4.14** Kurva Perbandingan  $N_{SPT}$  dan Kedalaman Tanah pada B28

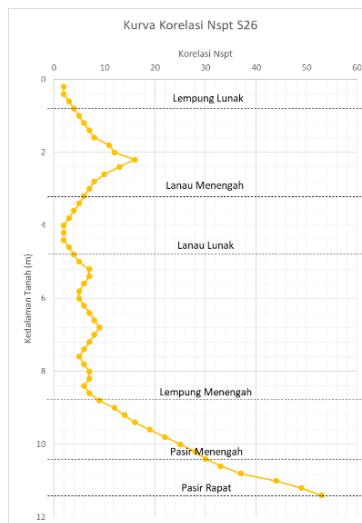

**Gambar 4.15** Kurva Perbandingan N<sub>SPT</sub> dan Kedalaman Tanah pada B29

**Gambar 4.16** Kurva Perbandingan N<sub>SPT</sub> dan Kedalaman Tanah pada B30

**Gambar 4.17** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S23

**Gambar 4.18** Kurva Perbandingan Korelasi N<sub>SPT</sub> dan Kedalaman Tanah pada S26

Pertama yang akan dibahas adalah data bor, pada zona ini terdapat 3 data bor B28, B29, dan B30. Ketiga data ini berada pada STA yang sama STA 42+251 dan dilakukan di hari yang sama pada tanggal 17 April, artinya tidak ada data yang memperbarui data lainnya. Ketiga data memiliki jenis tanah, konsistensi tanah, dan kedalaman *compressible soil* yang berbeda beda, oleh karenanya kita akan memilih salah satu data yang cenderung lebih jelek tanahnya untuk mewakili data bor pada titik tersebut. Data yang diambil adalah B30 karena memiliki *compressible soil* paling dalam yaitu 10 meter.

Selanjutnya untuk data sondir, melalui kurva kita dapat melihat bahwa keduanya memiliki kemiripan jenis dan konsistensi tanah, serta kedalaman *compressible soil* yang mirip yaitu pada 8,4 meter untuk S23 dan 8,8 meter untuk S26. Kedua data sondir tersebut dijadikan dalam satu zona dengan B30 karena jenis tanah cenderung tidak berbeda jauh, masih lanau atau lempung dan tidak ada pasir atau tanah keras diantara *compressible soil*.

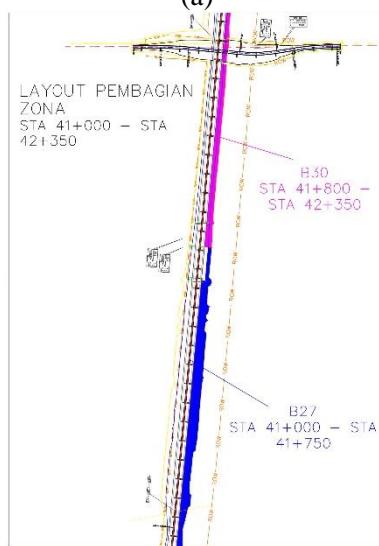

Perhitungan untuk perencanaan akan merujuk kepada data B30 karena meskipun zona ini mencakup data S23 dan S26, data bor dianggap lebih akurat dibandingkan data sondir yang harus menggunakan korelasi.

#### 4.1.7 Layout Pembagian Zona & Rekap Data Tiap Zona

Setelah analisa data tanah dan dilakukan pembagian zona, kita mendapatkan *section* 28 dibagi menjadi 2 zona B1 dan B2, dan *section* 41 juga dibagi menjadi 2 zona B27 dan B30. Untuk lebih jelasnya kita dapat melihat pada **Gambar 4.19**. Selanjutnya akan dilakukan rekap data pada masing-masing zona seperti terlihat pada contoh **Tabel 4.3** untuk zona B1, **Tabel 4.4** untuk zona B2, **Tabel 4.5** untuk zona B27, dan **Tabel 4.6** untuk zona B30. Fungsi dari rekap data tanah untuk memudahkan nantinya dalam perhitungan dan perencanaan.

## 4.2 Data Timbunan

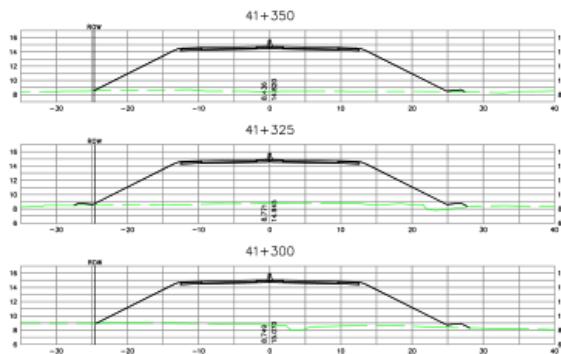

Kemiringan (*slope*) : 1 : 2

Lebar badan jalan rencana : 25 m

$\phi$  : 30°

$\gamma$  sat timbunan : 1,80 t/m<sup>3</sup>

Fluktuasi muka air banjir : 2 meter

**Gambar 4.20 Data Timbunan**

#### 4.2.1 Pembagian Timbunan

Tinggi timbunan yang ditinjau tiap 50 meter sangat beragam, oleh karenanya akan diambil beberapa tinggi timbunan dari tiap zonanya yang dirasa dapat mewakili sebagian lainnya. Fungsi dari pembagian tinggi timbunan yaitu agar memudahkan perencanaan dan juga memudahkan penggerjaan di lapangan. Pembagian hanya digunakan untuk mengeneralisasikan perbaikan tanah dasar dan perkuatan lereng, untuk volume tanah yang ditimbun tetap menggunakan kebutuhan aktual dari masing-masing tinggi rencana.

Zona B1 dibagi menjadi 3 tinggi timbunan yaitu 4 meter, 7 meter, dan 10 meter. Zona B2 dibagi menjadi 2 tinggi timbunan yaitu 4 meter dan 9 meter. Zona B27 dibagi menjadi 2 tinggi timbunan yaitu 8 meter dan 5 meter, dan Zona B30 disama ratakan menjadi 4 meter tinggi timbunan. Jadi ketika pada STA tertentu tinggi timbunan rencana kurang dari 4 meter, maka akan menggunakan perencanaan perbaikan tanah dasar dan perkuatan lereng untuk tinggi 4 meter. Pada **Tabel 4.7** dan **Tabel 4.8** terdapat rekap elevasi tanah dasar, elevasi timbunan, tinggi timbunan, pembagian zona, dan pembagian tinggi timbunan.

**Tabel 4.8** Rekap Pembagian Zona dan Tinggi Timbunan Section 41 (Zona B27 dan Zona B30)

#### **4.3 Data *Geotextile***

*Geotextile* digunakan pada alternatif timbunan. *Geotextile* direncanakan menggunakan spesifikasi Unggul-Tex UW 250 dengan *tensile strength* 52 KN/m produksi PT. Teknindo Geosistem Unggul. Spesifikasi selengkapnya dapat dilihat pada Lampiran 2.

#### **4.4 Data *Micropile***

*Micropile* direncanakan menggunakan milik WIKA BETON. Spesifikasi yang digunakan adalah cerucuk lingkaran dengan diameter 30 cm kelas C. Spesifikasi selengkapnya dapat dilihat pada Lampiran 2.

#### **4.5 Data *Prefabricated Vertical Drain***

*Prefabricated Vertical Drain* yang digunakan untuk membantu mempercepat pemampatan menggunakan merk CeTeau Drain CT-D812 produksi PT. Teknindo Geosistem Unggul dengan spesifikasi sebagai berikut:

- *Weight* = 70 g/m
- *Thickness (a)* = 100 mm
- *Width (b)* = 3 mm

Spesifikasi selengkapnya dapat dilihat pada Lampiran 2.

## BAB V

### PERENCANAAN DAN PEMILIHAN ALTERNATIF

#### 5.1 Perhitungan Preloading

Preloading merupakan proses pemberian tekanan pada tanah sesuai dengan beban yang akan diterima tanah saat nantinya akan beroperasi. Metode paling konvensional yaitu melakukan preloading dengan cara memberi beban berupa tanah timbunan.

##### 5.1.1 Perencanaan $S_c$ dan $H_{initial}$ Zona B1

Tinggi timbunan yang direncanakan pada Zona B1 paling tinggi adalah 10 meter, dengan kedalaman *compressible soil* 8 meter. Berdasarkan data tanah B1, jenis tanah pada kedalaman selanjutnya berupa lempung keras, maka jalan keluarnya air dalam tanah hanya atas. Untuk mendapatkan nilai  $H_{initial}$  dilakukan perhitungan pemampatan konsolidasi akibat variasi pemberian beban timbunan ( $q$ ). Variasi beban timbunan yang diberikan yaitu:

$$\begin{aligned} H \text{ timbunan} = 1 \text{ m} , q &= H * \gamma_{timb} = 1,8 \text{ t/m}^2 \\ H \text{ timbunan} = 2 \text{ m} , q &= H * \gamma_{timb} = 3,6 \text{ t/m}^2 \\ H \text{ timbunan} = 3 \text{ m} , q &= H * \gamma_{timb} = 5,4 \text{ t/m}^2 \\ H \text{ timbunan} = 4 \text{ m} , q &= H * \gamma_{timb} = 7,2 \text{ t/m}^2 \\ H \text{ timbunan} = 5 \text{ m} , q &= H * \gamma_{timb} = 9 \text{ t/m}^2 \\ H \text{ timbunan} = 6 \text{ m} , q &= H * \gamma_{timb} = 10,8 \text{ t/m}^2 \\ H \text{ timbunan} = 7 \text{ m} , q &= H * \gamma_{timb} = 12,6 \text{ t/m}^2 \\ H \text{ timbunan} = 8 \text{ m} , q &= H * \gamma_{timb} = 14,4 \text{ t/m}^2 \\ H \text{ timbunan} = 9 \text{ m} , q &= H * \gamma_{timb} = 16,2 \text{ t/m}^2 \\ H \text{ timbunan} = 10 \text{ m} , q &= H * \gamma_{timb} = 18,0 \text{ t/m}^2 \\ H \text{ timbunan} = 11 \text{ m} , q &= H * \gamma_{timb} = 19,8 \text{ t/m}^2 \end{aligned}$$

Beban tersebut didistribusikan ke kedalaman tanah yang ditinjau ( $z$ ) sebagai beban merata trapesium. Lalu dihitung tegangan tanah asli efektif ( $\sigma'_o$ ) dan distribusi tegangan akibat  $q$  total ( $\Delta\sigma'$ ). Berikut adalah contoh perhitungan tegangan tanah asli efektif ( $\sigma'_o$ ) akibat timbunan:

Pada lapisan 1:

$$H = 1 \text{ m}$$

$$Z = 0,5 \text{ m}$$

$$(\sigma' o) = \gamma' \times Z$$

$$= (0,246 \text{ t/m}^3) \times 0,5 \text{ m}$$

$$= 0,123 \text{ t/m}^2$$

Besar tegangan akibat beban timbunan ( $\Delta\sigma'$ ) ditentukan dengan Persamaan 2.7. Berikut adalah contoh perhitungan tegangan akibat beban timbunan ( $\Delta\sigma'$ ) dengan  $q = 1,8 \text{ t/m}^2$ :

Pada lapisan 1:

$$Z = 0,5 \text{ m}$$

$$\begin{aligned} B1 &= \frac{\text{lebar jalan rencana}}{2} \\ &= \frac{25 \text{ m}}{2} \\ &= 12,5 \text{ m} \end{aligned}$$

$$\begin{aligned} B2 &= 2 \times H \text{ total} \\ &= 2 \times 1 \text{ m} \\ &= 2 \text{ m} \end{aligned}$$

$$\begin{aligned} \alpha 1 &= \tan^{-1}\left(\frac{B1+B2}{Z}\right) - \tan^{-1}x\left(\frac{B1}{Z}\right) \text{ (radian)} \\ &= \tan^{-1}\left(\frac{12,5+2}{0,5}\right) - \tan^{-1}x\left(\frac{12,5}{0,5}\right) \text{ (radian)} \\ &= 0,316^\circ \end{aligned}$$

$$\begin{aligned} \alpha 2 &= \tan^{-1}x\left(\frac{B1}{Z}\right) \text{ (radian)} \\ &= \tan^{-1}x\left(\frac{12,5}{0,5}\right) \text{ (radian)} \\ &= 87,709^\circ \end{aligned}$$

$$q_0 = 1,8 \text{ t/m}^2$$

$$\begin{aligned} \Delta\sigma' &= \frac{q_0}{\pi} x \left[ \left( \frac{B1+B2}{B2} \right) x (\alpha 1 + \alpha 2) - \left( \frac{B1}{B2} x \alpha 2 \right) \right] \\ &= \frac{1,8}{\pi} x \left[ \left( \frac{12,5+2}{2} \right) x (0,316 + 87,709) - \left( \frac{12,5}{2} x 87,709 \right) \right] \\ &= 0,9 \text{ t/m}^2 \end{aligned}$$

$$\begin{aligned} 2\Delta\sigma' &= 2 \times 0,9 \text{ t/m}^2 \\ &= 1,8 \text{ t/m}^2 \end{aligned}$$

Hasil perhitungan  $\Delta\sigma'$  untuk seluruh lapisan ditampilkan pada Lampiran 3. Kemudian dilakukan perhitungan *settlement* yang terjadi akibat setiap  $q$  yang ditentukan. Berikut adalah contoh perhitungan *settlement* tanah dasar akibat beban timbunan sebesar  $q = 1,8 \text{ t/m}^2$ :

Pada lapisan 1:

$$\begin{aligned} H_i &= 1 \text{ m} \\ C_c &= 0,308 \\ C_s &= 0,048 \\ e_0 &= 1,56 \\ \sigma'_o &= 0,123 \text{ t/m}^2 \\ 2\Delta\sigma' &= 1,8 \text{ t/m}^2 \end{aligned}$$

$$\begin{aligned} \sigma'_o + 2\Delta\sigma' &= 0,123 \text{ t/m}^2 + 1,8 \text{ t/m}^2 \\ &= 1,923 \text{ t/m}^2 \end{aligned}$$

$$\begin{aligned} P_{\text{fluktuasi}} &= 2 \text{ t/m}^2 \\ \sigma'_c &= \sigma'_o + P_{\text{fluktuasi}} \\ &= 0,123 \text{ t/m}^2 + 2 \text{ t/m}^2 \\ &= 2,123 \text{ t/m}^2 \\ \text{OCR} &= \frac{\sigma'_c}{\frac{\sigma'_o}{2,123 \text{ t/m}^2}} \\ &= \frac{2,123 \text{ t/m}^2}{0,123 \text{ t/m}^2} \\ &= 17,2509 > 1 \rightarrow \text{OC} \end{aligned}$$

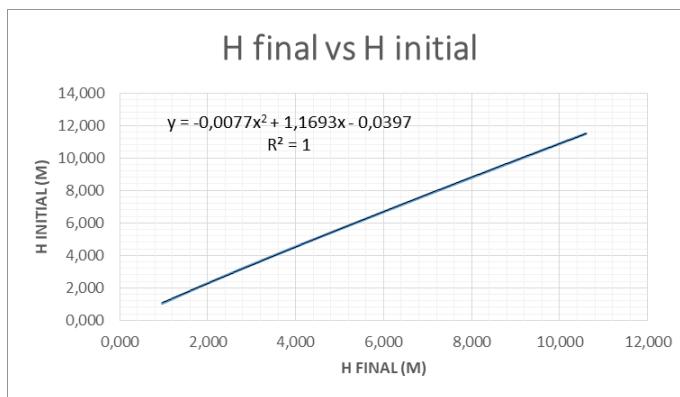

$\sigma'_o + \Delta\sigma' \leq \sigma'_c$ . Sehingga:

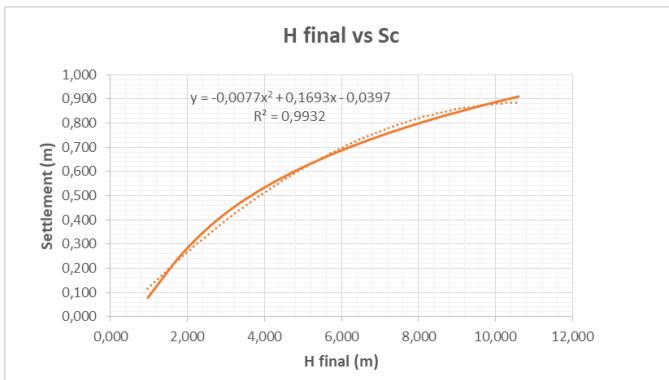

$$\begin{aligned} S_c &= \frac{C_s \cdot H_0}{1 + e_0} \cdot \log \frac{\sigma'_o + \Delta\sigma'}{\sigma'_o} \\ S_c &= \frac{0,048}{1+1,56} \cdot \log \frac{1,923}{0,123} \\ S_c &= 0,022 \text{ m} \end{aligned}$$

Total pemampatan yang terjadi dari seluruh layer tanah beban timbunan sebesar  $q = 1.8 \text{ t/m}^2$  adalah sebesar  $0,078 \text{ m}$ . Maka  $H_{\text{initial}} = 1,8 \text{ t/m}^2 + (0,078 \text{ m} * 1 \text{ t/m}^3) = 1,878 \text{ t/m}^2 / 1,8 \text{ t/m}^3 = 1,043 \text{ m}$ . Dari perhitungan variasi beban timbunan, dapat dibuat rekap pada **Tabel 5.1** dan **Tabel 5.2** serta diperjelas dengan grafik **Gambar 5.1** dan **Gambar 5.2**.

### 5.1.2 Perhitungan Pemampatan $H_{\text{final}} = 10 \text{ m}$

Direncanakan timbunan dengan rencana  $H_{\text{final}} = 10 \text{ m}$ , maka butuh menimbun awalnya setinggi 10,9 m.  $\gamma_{\text{sat}}$  timbunan = 1,8 t/m<sup>3</sup>. Maka direncanakan  $q = 19,6 \text{ t/m}^2$ . Tabel perhitungan mencari  $Sc$  dapat dilihat pada **Tabel 5.3**.

**Tabel 5.3**Perhitungan Pemampatan Zona B1  $H_{\text{final}} = 10 \text{ m}$

## 5.2 Perencanaan Perbaikan Tanah dengan PVD

### 5.2.1 Perhitungan Waktu Konsolidasi ( $t$ )

Berikut ini adalah contoh perhitungan waktu konsolidasi untuk tanah dasar Zona B1 dengan  $H_{initial} = 10,9$  m atau  $q = 19,6$   $t/m^2$ :

$$T_{v90} = 0,848$$

$$H_{dr} = 8 \text{ meter}$$

$$C_v = \frac{(H_1 + H_2 + \dots + H_n)^2}{\left( \frac{H_1}{\sqrt{Cv_1}} + \frac{H_2}{\sqrt{Cv_2}} + \dots + \frac{H_n}{\sqrt{Cv_n}} \right)^2} \quad (\text{Persamaan 2.20})$$

$$= \frac{(6+2)^2}{\left( \frac{6}{\sqrt{0,00203}} + \frac{2}{\sqrt{0,00244}} \right)^2}$$

$$= 0,00212502 \text{ cm}^2/\text{detik}$$

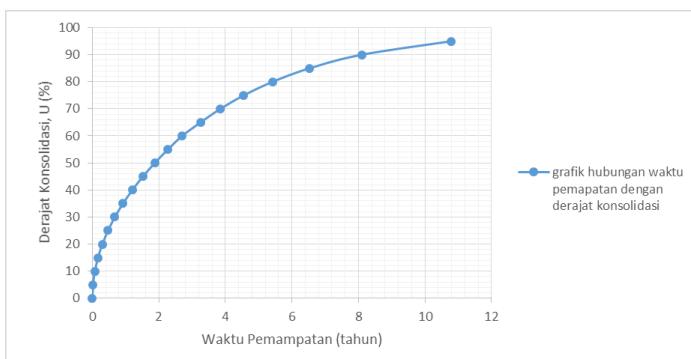

$$= 67014,7142 \text{ cm}^2/\text{tahun}$$

$$t = \frac{T_v \cdot (H_{dr})^2}{C_v}$$

$$t = \frac{0,848 \cdot (800 \text{ cm})^2}{67014,7142 \text{ cm}^2/\text{tahun}}$$

$$= 8,099 \text{ tahun}$$

Karena waktu yang dibutuhkan untuk konsolidasi sebesar 90% cukup lama, maka diperlukan bantuan *vertical drain* untuk mempercepat waktu konsolidasi tersebut. Jenis *vertical drain* yang dipakai adalah *Prefabricated Vertical Drain* (PVD).

Gambar 5.3 Grafik Waktu Konsolidasi Zona B1

### 5.2.2 Perencanaan Kedalaman PVD

Kedalaman tanah mampu mampat pada B1 yaitu sampai kedalaman 8 meter, apabila mampu memasang PVD kurang dari 8 meter dan tetap dalam kondisi aman dengan asumsi penurunan 2 cm/tahun, maka biaya yang digunakan dapat berkurang dibandingkan apabila memasang PVD sampai 8 meter.

Penurunan dibagi menjadi 2 bagian yaitu, penurunan jangka pendek, yang merupakan penurunan akibat PVD. Penurunan jangka panjang, yang merupakan penurunan akibat pemampatan lapisan tanah di bawah kedalaman ujung PVD. Penurunan dapat diterima bila kecepatan penurunan jangka panjang rata-rata per tahun  $\leq 2$  cm/tahun. Diasumsikan jika berjalan 3 tahun melakukan overlay. Hasil penentuan kedalaman PVD dapat dilihat pada **Tabel 5.4**.

$$\begin{aligned} \text{Tv 3 tahun} &= \left( \frac{3x Cv gab}{Hd r^2} \right) \\ \text{Tv} &= \left( \frac{3x 67014,7}{800^2} \right) = 0,3141 \\ \text{Uv} &= \frac{4x Tv}{\pi^{0,5}} \\ \text{Uv} &= 63\% \end{aligned}$$

Contoh perhitungan apabila PVD sampai kedalaman 1 meter:

Sc pada kedalaman 0m - 1m = 0,14m = Sc akibat PVD

Sc pada kedalaman 1m - 8m = 0,766m = Sc sisa

Sc 3 tahun kemudian =  $0,766 * 63\% = 0,484$  m = 48,4 cm  
dalam 3 tahun

Sc cm/tahun =  $16,15 \geq 2$  cm (PWD masih kurang dalam)

Apabila PVD sampai kedalaman 2 meter:

Sc pada kedalaman 0m - 2m = 0,266 = Sc akibat PVD

Sc pada kedalaman 2m - 14m = 0,64m = Sc sisa

Sc 3 tahun kemudian  $0,64 * 63\% = 0,404$  m = 40,4 cm  
dalam 3 tahun

Sc cm/tahun =  $13,48 \geq 2$  cm (PWD masih kurang dalam).  
Perhitungan dilakukan sampai Sc cm/tahun nya dibawah 2 cm/tahun. Kedalaman PVD yang digunakan dapat dilihat pada **Tabel 5.4**.

**Tabel 5.4** Perbandingan Kedalaman PVD dalam *Rate of Settlement*

| Kedalaman PVD yang ditanam(m) | Sc akibat PVD (m) | sc n tahun kemudian (sc yang tidak dicapai PVD) (m) | rate of settlement (cm per tahun) |
|-------------------------------|-------------------|---|-----------------------------------|
| 0                             | 0                 | 0,000   | 0,00                              |
| 1                             | 0,140             | 0,484   | 16,15                             |
| 2                             | 0,266             | 0,404   | 13,48                             |
| 3                             | 0,385             | 0,329   | 10,98                             |
| 4                             | 0,497             | 0,258   | 8,61                              |
| 5                             | 0,605             | 0,190   | 6,35                              |
| 6                             | 0,707             | 0,125   | 4,18                              |
| 7                             | 0,809             | 0,061   | 2,05                              |
| 8                             | 0,906             | 0,000   | 0,00                              |

Namun pada kondisi ini hingga kedalaman 7 meter, *rate of settlement* tidak mencapai kurang dari 2 cm/tahun, oleh karenanya tidak bisa menggunakan panjang PVD kurang dari 8 meter. Contoh lain yaitu pada Zona B30 yang memiliki *compressible soil* sedalam 10 meter namun didapatkan *rate of settlement* kurang dari 2 cm/tahun ketika di kedalaman 8 meter, dapat dilihat di **Tabel 5.5**. Maka Cv gabungan yang dipakai hanya sampai kedalaman 8 m seperti terlihat pada **Tabel 5.6**.

**Tabel 5.5** Perbandingan Kedalaman PVD dan *Rate of Settlement* Zona B30

| Kedalaman PVD yang ditanam(m) | Sc akibat PVD (m) | sc n tahun kemudian (sc yang tidak dicapai PVD) (m) | rate of settlement (cm per tahun) |

### 5.2.3 Perencanaan *Prefabricated Vertical Drain* (PWD)

Tujuan dari pemasangan PVD pada perencanaan ini adalah untuk membantu mempercepat proses pemampatan konsolidasi, sehingga dapat berlangsung dengan waktu yang relatif singkat. Perencanaan PVD dalam Tugas Akhir ini menggunakan pola persegi dan pola segitiga, dengan jarak antar PVD (S) yang dihitung adalah 0,5; 0,75; 1; 1,25; 1,5; 1,75; 2; 2,25 meter. Dengan pola pemasangan segitiga dan segiempat :

D = diameter ekivalen dari lingkaran tanah  
yang merupakan daerah pengaruh dari  
*vertical drain*.  
= 1,05 x S untuk segitiga  
= 1,13 x S untuk segiempat

#### 5.2.3.1 Perencanaan PVD dengan Pola Segitiga

Berikut adalah contoh perhitungan perencanaan PVD pola segitiga untuk sisi sebelum sungai dengan jarak S= 2,25 m:

- Menghitung Fungsi Hambatan PVD (F(n)).

D = diameter ekivalen dari lingkaran tanah  
yang merupakan daerah pengaruh dari  
*vertical drain*.

$$\begin{aligned}
 &= 1,05 \times S \\
 &= 1,05 \times 2,25 \\
 &= 2,3625 \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 dw &= 2(a+b)/\pi \\
 &= 2(100+3)/\pi \\
 &= 51,5 \text{ mm}
 \end{aligned}$$

$$\begin{aligned}
 n &= D/dw \\
 &= 2,3625 \text{ m} / 0,0515 \text{ m} \\
 &= 45,8738
 \end{aligned}$$

$$\begin{aligned}
 F(n) &= [\ln(n) - 3/4] \\
 F(n) &= [\ln(45,9) - 3/4] \\
 F(n) &= 3,076
 \end{aligned}$$

• Menghitung Derajat Konsolidasi Tanah Akibat Aliran Air Arah Vertikal ( $U_v$ ) dengan PVD

Dalam hal ini besarnya  $U_v$  diasumsikan kurang dari 60% sehingga untuk memperoleh nilai  $U_v$  maka terlebih dahulu perlu mengetahui nilai  $T_v$ .

$$\begin{aligned}
 C_v &= 0,000000213 \text{ m}^2/\text{dtk} \\
 t &= 1 \text{ minggu} = 604800 \text{ detik} \\
 H_{dr} &= 8 \text{ m} = 800 \text{ cm} \\
 T_v &= \text{faktor waktu} = \frac{t \times C_v}{(H_{dr})^2} \\
 &= \frac{1 \text{ minggu} \times (604800 \text{ detik}) \times 0,000000213 \text{ m}^2/\text{detik}}{(8 \text{ m})^2} \\
 &= 0,0020 \\
 U_v &= \left( 2 \sqrt{\frac{T_v}{\pi}} \right) \times 100\% \\
 &= \left( 2 \sqrt{\frac{0,002}{\pi}} \right) \times 100\% \\
 &= 0,0506
 \end{aligned}$$

- Menghitung Derajat Konsolidasi Tanah Akibat Aliran Air Arah Horizontal (Uh)

$$C_{vgab} = 0,000000213 \text{ m}^2/\text{dtk}$$

$$K_h/K_v = 3$$

$$\text{Lebar PVD (a)} = 100 \text{ mm}$$

$$\text{Tebal PVD (b)} = 3 \text{ mm}$$

$$d_w = 51,5 \text{ mm}$$

$$C_h = 3 \times C_v$$

$$= 3 \times 0,000000213 \text{ m}^2/\text{detik}$$

$$= 0,000000629 \text{ m}^2/\text{detik}$$

$$U_h = \left[ 1 - \left( \frac{1}{e^{\left( \frac{tx8xCh}{D^2x2xF(n)} \right)}} \right) \right]$$

$$= \left[ 1 - \left( \frac{1}{e^{\left( \frac{(1 \times 604800) \times 8 \times 0,000000629}{1,05^2 \times 2 \times 3,076} \right)}} \right) \right]$$

$$= 0,08592$$

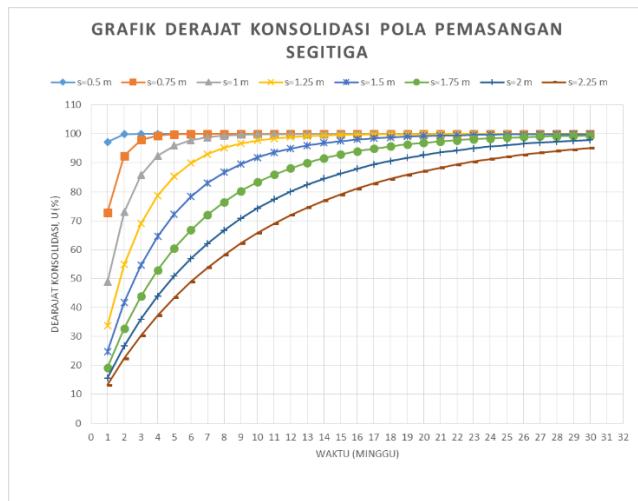

- Menghitung Derajat Konsolidasi Rata-Rata (U rata-rata)

$$U \text{ rata-rata} = (1-(1-U_h) \times (1-U_v) \times 100\%)$$

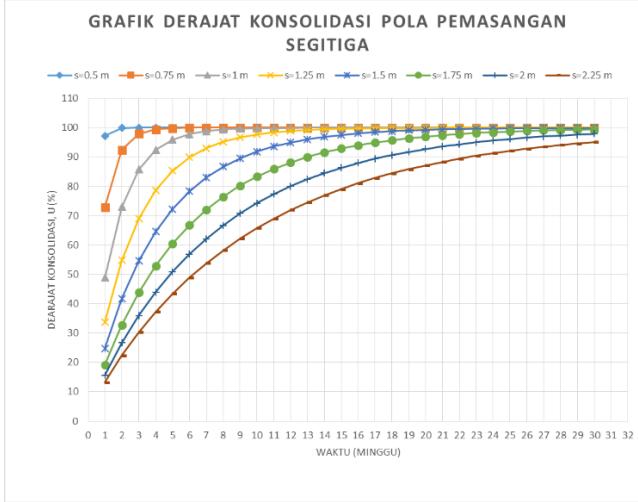

$$= (1-(1-0,0859) \times (1-0,0506) \times 100\%) = 13,21 \%$$

Perhitungan diatas dilakukan untuk seluruh jarak PVD (S).

Pada **Gambar 5.4** ditampilkan grafik hubungan waktu dengan derajat konsolidasi dengan menggunakan PVD pola segitiga dan pola segiempat.

(a)

(b)

**Gambar 5.4** Grafik Hubungan Derajat Konsolidasi (U) dengan Waktu Timbunan dengan PVD (a) Pola Segitiga dan (b) Pola Segiempat

Dari **Gambar 5.4** dipilih jarak antar PVD pola segitiga yang dipakai adalah 2,25 m. Pada **Tabel 5.7** dapat dilihat derajat konsolidasi per minggu nya apabila menggunakan PVD pola segitiga dengan jarak 2,25 meter.

**Tabel 5.7** Derajat Konsolidasi PVD Pola Segitiga Jarak 2,25 m

| segitiga | 2,25   |    |        |    |        |
|----------|--------|----|--------|----|--------|
| t        | Ugab   |    |        |    |        |
| (minggu) | (%)    |    |        |    |        |
| 1        | 13,214 | 9  | 62,206 | 17 | 82,813 |
| 2        | 22,420 | 10 | 65,787 | 18 | 84,409 |
| 3        | 30,313 | 11 | 69,017 | 19 | 85,855 |
| 4        | 37,246 | 12 | 71,933 | 20 | 87,166 |
| 5        | 43,400 | 13 | 74,567 | 21 | 88,353 |
| 6        | 48,892 | 14 | 76,948 | 22 | 89,429 |
| 7        | 53,812 | 15 | 79,101 | 23 | 90,405 |
| 8        | 58,231 | 16 | 81,049 | 24 | 91,290 |

### 5.3 Perhitungan Peningkatan Kohesi *Undrained* ( $C_u$ )

Perhitungan peningkatan nilai  $C_u$  perlu dilakukan untuk menentukan apakah tanah dasar mampu memikul beban timbunan dengan peningkatan nilai  $C_u$  akibat adanya penimbunan dan bantuan PVD. Perhitungan tersebut dilakukan per tahap timbunan agar dapat dicari SF dari tiap tahapan timbunan melalui program bantu XSTABL. Contoh berikut **Tabel 5.8** dan **Tabel 5.9** adalah perhitungan Zona B1 pada tahap ke 15 dengan menggunakan peningkatan saat minggu ke 15. Zona B1 sendiri untuk timbunan  $H_{final}$  10 m memiliki  $H_{initial}$  10,9 m dibagi menjadi 22 tahap dengan tinggi timbunan per tahap 0,5 m.

- Menghitung tegangan di tiap lapisan tanah

Perhitungan perubahan tegangan didapat dari :

$$\sigma' = P_o + \Delta\sigma'$$

$(\Delta P_i)$  dengan distribusi tegangan sesuai dengan kedalaman yang ditinjau.

Hasil perhitungan  $\Delta\sigma'$  dan  $\Delta P$  ditampilkan pada **Tabel 5.8**.

**Tabel 5.8** Perubahan Tegangan Efektif Tanah Akibat Penimbunan

| Tegangan efektif untuk U 100% |   |     |      | Derajat Konsolidasi U<100% |        |       |      |
|-------------------------------|---|-----|------|----------------------------|--------|-------|------|
| Depth (m)                     |   | z   | Po'  | σ15'                       | Po'    | ΔP15' | Σσp' |
|                               |   | (m) | t/m2 | t/m2                       | KN/m2  | KN/m2 |      |
| 0                             | - | 1   | 0,5  | 0,123                      | 13,565 |       |      |
| 1                             | - | 2   | 1,5  | 0,369                      | 13,780 |       |      |
| 2                             | - | 3   | 2,5  | 0,615                      | 13,987 |       |      |
| 3                             | - | 4   | 3,5  | 0,861                      | 14,185 |       |      |
| 4                             | - | 5   | 4,5  | 1,108                      | 14,373 |       |      |
| 5                             | - | 6   | 5,5  | 1,354                      | 14,551 |       |      |
| 6                             | - | 7   | 6,5  | 1,613                      | 14,733 |       |      |
| 7                             | - | 8   | 7,5  | 1,887                      | 14,919 |       |      |

- Menghitung kenaikan harga Cu. Hasil perhitungan peningkatan nilai Cu ditampilkan pada **Tabel 5.9**.

**Tabel 5.9** Hasil Perhitungan Peningkatan Nilai Cu

| Σσp'  | Kedalaman |     | PI | Cu lama | cek tanah asli (rumus)<br>(Ardana & Mochtar) | Cu tanah asli pakai<br>(Ardana & Mochtar) | Cu baru            |
|-------|-----------|-----|----|---------|--|---|--------------------|
|       | kg/cm2    | (m) |    |         |  |   | (Ardana & Mochtar) |
| 0,695 | 0         | -   | 1  | 8,54    | 0,153  | 0,076                                     | 0,153              |

|       |           |     |    |         |  |   | 0,228              |

### 5.3.1 Rekap Peningkatan Cu Tiap Zona

Perhitungan kenaikan Cu yang dilakukan seperti pada sub bab sebelumnya dilakukan pada tiap zona dan tiap variasi tinggi timbunan. Pada **Tabel 5.10** dapat kita lihat rekapitulasi kenaikan Cu dari tiap zona pada tahap penimbunan terakhir di minggu ketika U mencapai 90%.

**Tabel 5.10** Rekap Peningkatan Cu Tiap Zona

| Zona & Tinggi Timbunan                 | Lapisan 1     |               | Lapisan 2     |               |
|--|---------------|---------------|---------------|---------------|
|  | Cu Lama (kpa) | Cu Baru (kpa) | Cu Lama (kpa) | Cu Baru (kpa) |
| Zona B1 Hfinal 4 m Tahap 9 Minggu 23   | 15,3          | 20,4          | 24,7          | 24,7          |
| Zona B1 Hfinal 7 m Tahap 16 Minggu 23  | 15,3          | 27,3          | 24,7          | 28,4          |
| Zona B1 Hfinal 10 m Tahap 22 Minggu 23 | 15,3          | 31,1          | 24,7          | 32,2          |
| Zona B2 Hfinal 4 m Tahap 8 Minggu 16   | 11,4          | 19            | -             | -             |
| Zona B2 Hfinal 9 m Tahap 19 Minggu 19  | 11,4          | 30,8          | -             | -             |
| Zona B27 Hfinal 5 m Tahap 12 Minggu 21 | 11            | 20,1          | 12            | 22,5          |
| Zona B27 Hfinal 8 m Tahap 18 Minggu 22 | 11            | 24,9          | 12            | 27,2          |
| Zona B30 Hfinal 4 m Tahap 9 Minggu 24  | 14,6          | 19,7          | 12,1          | 23,2          |

#### 5.4 Perhitungan Kuat Lereng dengan XSTABL

Berdasarkan perhitungan sebelumnya kita bisa mendapat nilai  $C_u$  yang sudah meningkat dan juga penurunan yang terjadi dari setiap tahap penimbunan. Hasil tersebut akan dimasukkan ke dalam program XSTABL untuk membantu mencari SF. Proses mencari SF dilakukan per tahap timbunan agar dapat diketahui pada tahap mana timbunan tersebut mulai mencapai SF yang tidak aman sehingga kita bisa menentukan langkah yang harus dikerjakan.

Berdasarkan SNI 8460-2017 standar dikatakan SF tidak aman adalah kurang dari 1,25 ketika masa penimbunan dan kurang dari 1,5 ketika penimbunan selesai. Apabila pada tahap tertentu dalam masa penimbunan SF tidak melebihi 1,25, proses menimbun bisa dihentikan dahulu dan menunggu kenaikan  $C_u$  pada minggu selanjutnya. Setelah itu akan diproses lagi di program XSTABL untuk melihat apakah SF sudah lebih dari 1,25. Ketika SF dalam masa penimbunan melebihi 1,25 proses menimbun bisa dilanjutkan, jika belum bisa menunggu lagi hingga kenaikan  $C_u$  cukup mencapai SF 1,25.

Tujuan dalam proses ini adalah agar tidak ada lereng yang longsor ketika masa penimbunan, selain itu untuk menghemat dalam perencanaan perkuatan lereng. Penghematan yang dimaksudkan adalah apabila lereng timbunan sudah cukup kuat hanya dengan proses menunggu kenaikan  $C_u$ , kita tidak perlu melakukan perkuatan pada lereng timbunan tersebut.

Cara menunggu seperti ini bisa dilakukan sebanyak dan selama mungkin asalkan tidak melebihi waktu perencanaan timbunan. Perencanaan waktu penimbunan paling lama adalah 24 minggu karena ketika melebihi itu dikhawatirkan adanya *clogging* pada PVD dan penurunan tidak lagi efektif. Namun ketika cara menunggu melebihi batas waktu perencanaan 24 minggu, maka harus diberi perkuatan.

#### **5.4.1 SF pada Zona B1 $H_{final}$ 10 meter**

Zona B1 dibagi menjadi 3 tinggi timbunan, pertama yang akan dibahas adalah  $H_{final}$  final 10 meter yang memiliki  $H_{initial}$  10,9 meter. Timbunan ini dikerjakan dalam 22 tahap seperti terlihat pada **Tabel 5.10**, artinya apabila dalam masa penimbunan ada tahap yang tidak aman yaitu SF 1,25 kita hanya bisa menggunakan cara menunggu kenaikan  $C_u$  selama 2 minggu. Apabila sudah 2x menunggu dan masih ada tahapan yang tidak aman, harus menggunakan perkuatan untuk lereng timbunan.

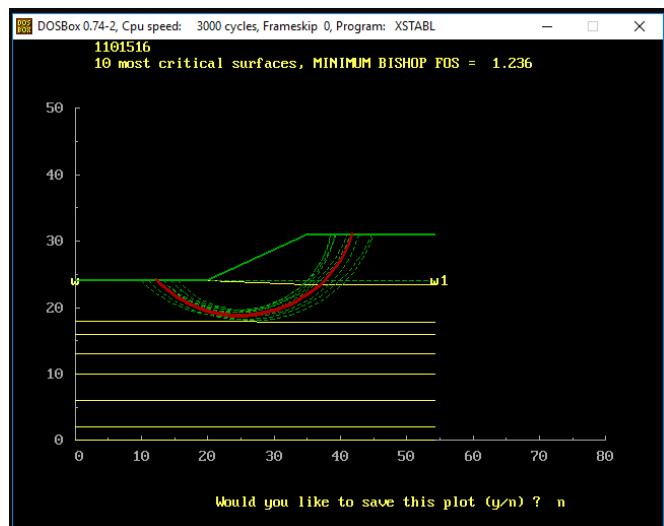

**Tabel 5.11** Tahap Penimbunan B1  $H_{final}$  10 meter

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,5      |
| 8     | 0,5      |
| 9     | 0,5      |
| 10    | 0,5      |
| 11    | 0,5      |
| 12    | 0,5      |
| 13    | 0,5      |
| 14    | 0,5      |
| 15    | 0,5      |
| 16    | 0,5      |
| 17    | 0,5      |
| 18    | 0,5      |
| 19    | 0,5      |
| 20    | 0,5      |
| 21    | 0,5      |
| 22    | 0,4      |
| Total | 10,9     |

Setelah diproses dengan program bantu XSTABL untuk mencari SF pada tiap tahap. Ditemukan pada tahap ke 15 timbunan (minggu 15) mulai mencapai SF tidak aman, seperti terlihat pada **Gambar 5.5**. Cara pertama yang dilakukan adalah menghentikan penimbunan untuk menunggu peningkatan  $C_u$  pada minggu selanjutnya.  $C_u$  baru (tahap 15 minggu 16) diproses lagi di XSTABL untuk dicek ulang apakah SF sudah aman. Pada **Gambar 5.6** kita bisa melihat bahwa SF masih tidak aman, maka akan ditunggu lagi. Pada tahap 15 minggu 17 didapatkan SF lebih dari 1,25 (**Gambar 5.7**), oleh karenanya penimbunan dapat dilanjutkan kembali. Namun pada tahap 16 minggu 18 didapatkan SF kembali tidak aman (**Gambar 5.8**).

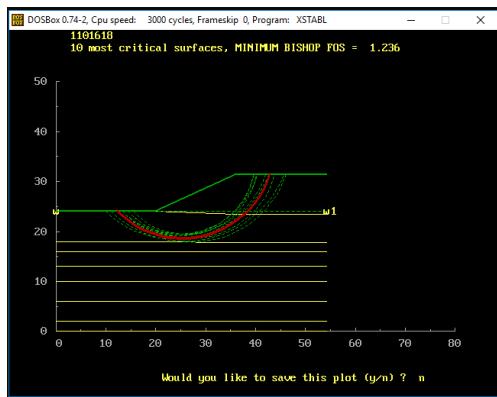

Gambar 5.5 SF Tahap 15 Minggu 15 Zona B1  $H_{final}$  10 meter

Gambar 5.6 SF Tahap 15 Minggu 16 Zona B1  $H_{final}$  10 meter

**Gambar 5.7** SF Tahap 15 Minggu 17 Zona B1  $H_{final}$  10 meter

**Gambar 5.8** SF Tahap 16 Minggu 18 Zona B1  $H_{final}$  10 meter

Timbunan zona B1  $H_{final}$  10 meter memiliki 22 tahap sedangkan batas waktu perencanaan hanya 24 minggu, jadi ketika proses menunggu sudah dilakukan 2x atau 2 minggu dan masih didapat SF tidak aman ketika masa penimbunan, maka wajib diberi perkuatan. Perkuatan dihitung ketika kondisi SF terjelek yaitu pada tahap penimbunan terakhir 22 dan minggu 23 (U90%) seperti terlihat pada **Gambar 5.9**. Rekap SF tiap tahap zona B1  $H_{final}$  10 meter dapat dilihat di **Tabel 5.11**, dan untuk lengkapnya

hasil SF dari XSTABL tiap tahap penimbunan terdapat pada Lampiran 3.

**Gambar 5.9** SF Tahap 22 Minggu 23 Zona B1  $H_{final}$  10 meter

**Tabel 5.12** Rekap SF Tiap Tahap Zona B1  $H_{final}$  10 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 9,650 |
| 2                | 2     | 4,777 |
| 3                | 3     | 3,302 |
| 4                | 4     | 2,762 |
| 5                | 5     | 2,29  |
| 6                | 6     | 1,985 |
| 7                | 7     | 1,813 |
| 8                | 8     | 1,649 |
| 9                | 9     | 1,543 |
| 10               | 10    | 1,432 |
| 11               | 11    | 1,358 |
| 12               | 12    | 1,321 |
| 13               | 13    | 1,275 |
| 14               | 14    | 1,254 |
| 15               | 15    | 1,22  |
| 16               | 15    | 1,236 |
| 17               | 15    | 1,251 |
| 18               | 16    | 1,236 |
| Minggu 23 (U90%) |       | 1,123 |

#### 5.4.2 SF pada Zona B1 $H_{final}$ 7 meter

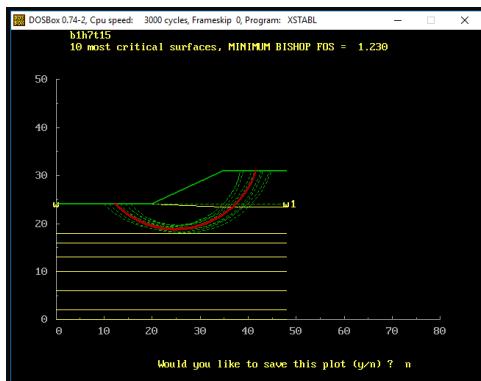

Tinggi timbunan kedua yang direncanakan dalam zona B1 adalah 7 meter. Timbunan ini dibagi menjadi 16 tahap seperti

terlihat pada **Tabel 5.12**. Dengan lama maksimal perencanaan 24 minggu, artinya kita hanya boleh melakukan proses menunggu maksimal 8 minggu.

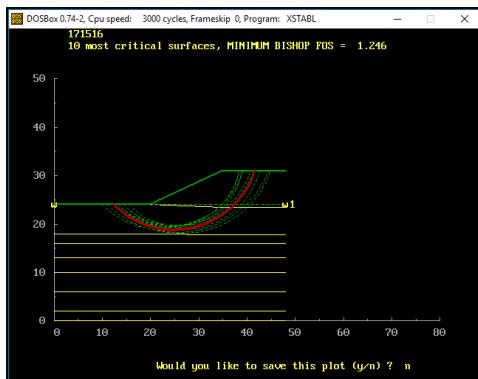

**Tabel 5.13** Tahap Penimbunan B1 H<sub>final</sub> 7 meter

| Tahap | H   |
|-------|-----|
|       | (m) |
| 1     | 0,5 |
| 2     | 0,5 |
| 3     | 0,5 |
| 4     | 0,5 |
| 5     | 0,5 |
| 6     | 0,5 |
| 7     | 0,5 |
| 8     | 0,5 |
| 9     | 0,5 |
| 10    | 0,5 |
| 11    | 0,5 |
| 12    | 0,5 |
| 13    | 0,5 |
| 14    | 0,5 |
| 15    | 0,4 |
| 16    | 0,4 |
| Total | 7,8 |

Setelah diproses di program bantu, kita mendapatkan pada tahap 15 SF tidak aman. Dilakukan proses menunggu hingga kenaikan C<sub>u</sub> cukup untuk menahan timbunan tidak longsor seperti terlihat pada gambar-gambar berikut ini.

**Gambar 5.10** SF Tahap 15 Minggu 15 Zona B1 H<sub>final</sub> 7 meter

**Gambar 5.11** SF Tahap 15 Minggu 16 Zona B1  $H_{final}$  7 meter

**Gambar 5.12** SF Tahap 15 Minggu 17 Zona B1  $H_{final}$  7 meter

Tahap 15 harus ditunggu 2 minggu hingga ke minggu 17 baru mencapai SF aman, setelah itu baru bisa dilanjutkan penimbunan untuk tahap 16 atau tahap terakhir. Pada tahap 16 kita tetap memerlukan perkuatan untuk lereng karena SF tidak lebih dari 1,5 untuk bisa dikatakan aman. SF yang digunakan untuk perkuatan adalah SF pada tahap 16 (tahap terakhir) pada minggu 23 ketika U mencapai 90% (**Gambar 5.13**), untuk rekap SF per tahap yang didapat dari XSTABL dapat juga kita lihat pada **Tabel 5.13**.

**Gambar 5.13 SF Tahap 16 Minggu 23 Zona B1  $H_{final}$  7 meter**

**Tabel 5.14 Rekap SF Tiap Tahap Zona B1  $H_{final}$  7 meter**

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 9,650 |
| 2                | 2     | 4,777 |
| 3                | 3     | 3,302 |
| 4                | 4     | 2,762 |
| 5                | 5     | 2,29  |
| 6                | 6     | 1,985 |
| 7                | 7     | 1,813 |
| 8                | 8     | 1,649 |
| 9                | 9     | 1,543 |
| 10               | 10    | 1,432 |
| 11               | 11    | 1,362 |
| 12               | 12    | 1,322 |
| 13               | 13    | 1,275 |
| 14               | 14    | 1,254 |
| 15               | 15    | 1,23  |
| 16               | 15    | 1,246 |
| 17               | 15    | 1,259 |
| 18               | 16    | 1,236 |
| Minggu 23 (U90%) |       | 1,246 |

### 5.4.3 SF pada Zona B1 $H_{final}$ 4 meter

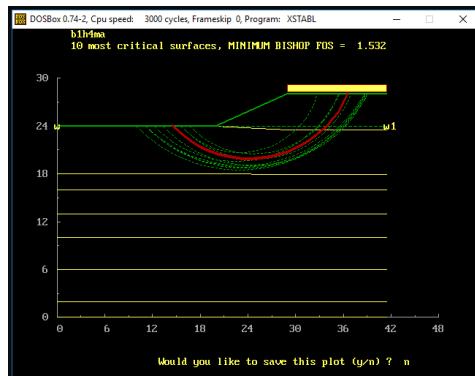

Tinggi timbunan paling rendah yang direncanakan dalam zona B1 adalah tinggi 4 meter. Timbunan ini dibagi menjadi 9 tahap penimbunan (9 minggu) seperti terlihat pada **Tabel 5.14**. Lama penimbunan maksimal hanya boleh 24 minggu artinya

apabila dalam proses penimbunan ada tahap yang tidak aman, kita boleh menunggu kenaikan  $C_u$  hingga 15 minggu.

**Tabel 5.15** Tahap Penimbunan B1  $H_{final}$  4 meter

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,5      |
| 8     | 0,5      |
| 9     | 0,5      |
| Total | 4,5      |

Setelah tiap tahap penimbunan di-run di XSTABL, kita mendapatkan bahwa setiap tahap timbunan mempunyai SF lebih dari 1,25, artinya tidak perlu ada proses menunggu dalam tahap penimbunan. Pada tahap terakhir pun SF yang dimiliki lebih dari 1,5, artinya tidak perlu merencanakan perkuatan untuk lereng timbunan. Berikut pada **Gambar 5.14** terdapat hasil SF dari XSTABL pada tahap terakhir dan pada minggu 23 ketika U mencapai 90%, juga pada **Tabel 5.14** terdapat rekapan SF dari tiap tahap penimbunan.

**Gambar 5.14** SF Tahap 9 Minggu 23 Zona B1  $H_{final}$  4 meter

**Tabel 5.16** Rekap SF Tiap Tahap Zona B1 H<sub>final</sub> 4 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 9,650 |
| 2                | 2     | 4,777 |
| 3                | 3     | 3,302 |
| 4                | 4     | 2,762 |
| 5                | 5     | 2,29  |
| 6                | 6     | 1,985 |
| 7                | 7     | 1,813 |
| 8                | 8     | 1,649 |
| 9                | 9     | 1,543 |
| Minggu 23 (U90%) |       | 1,532 |

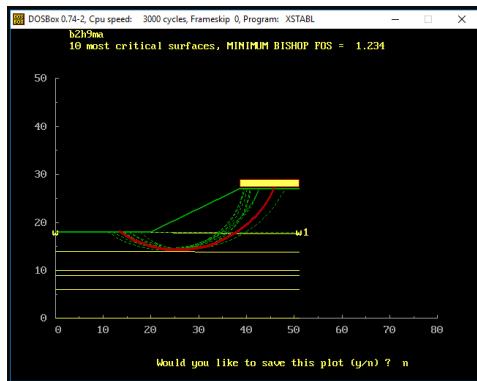

#### 5.4.4 SF pada Zona B2 H<sub>final</sub> 9 meter

Zona B2 memiliki 2 perencanaan tinggi timbunan yaitu 9 meter dan 4 meter. Pada bagian ini kita akan membahas terlebih dahulu timbunan tinggi 9 meter, timbunan ini dikerjakan dalam 19 tahap. Dengan maksimal perencanaan 24 minggu, kita hanya bisa melakukan proses menunggu selama 5 minggu.

**Tabel 5.17** Tahap Penimbunan B2 H<sub>final</sub> 9 meter

| Tahap | H   |
|-------|-----|
|       | (m) |
| 1     | 0,5 |
| 2     | 0,5 |
| 3     | 0,5 |
| 4     | 0,5 |
| 5     | 0,5 |
| 6     | 0,5 |
| 7     | 0,5 |
| 8     | 0,5 |
| 9     | 0,5 |
| 10    | 0,5 |
| 11    | 0,5 |
| 12    | 0,5 |
| 13    | 0,5 |
| 14    | 0,5 |
| 15    | 0,5 |
| 16    | 0,5 |
| 17    | 0,5 |
| 18    | 0,4 |
| 19    | 0,4 |
| Total | 9,3 |

Setelah dikerjakan dengan program bantu, kita mendapatkan SF dari tiap tahap lebih dari 1,25 seperti pada **Tabel 5.16**, artinya tidak perlu menunggu dalam tahap penimbunan. Namun pada tahap terakhir SF yang didapatkan masih kurang dari 1,5 seperti terlihat pada **Gambar 5.15**, artinya tetap memerlukan perkuatan lereng. SF untuk masing-masing timbunan lebih lengkapnya terdapat pada Lampiran 3.

**Gambar 5.15** SF Tahap 19 Minggu 19 Zona B2  $H_{final}$  9 meter

**Tabel 5.18** Rekap SF Tiap Tahap Zona B2  $H_{final}$  9 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 7,612 |
| 2                | 2     | 3,961 |
| 3                | 3     | 2,818 |
| 4                | 4     | 2,279 |
| 5                | 5     | 1,94  |
| 6                | 6     | 1,778 |
| 7                | 7     | 1,639 |
| 8                | 8     | 1,537 |
| 9                | 9     | 1,465 |
| 10               | 10    | 1,409 |
| 11               | 11    | 1,357 |
| 12               | 12    | 1,338 |
| 13               | 13    | 1,315 |
| 14               | 14    | 1,333 |
| 15               | 15    | 1,306 |
| 16               | 16    | 1,303 |
| 17               | 17    | 1,282 |
| 18               | 18    | 1,275 |
| Minggu 19 (U90%) |       | 1,234 |

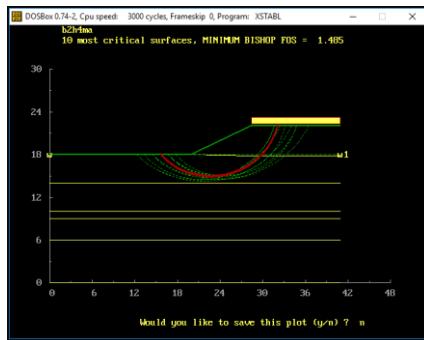

#### 5.4.5 SF pada Zona B2 $H_{final}$ 4 meter

Timbunan kedua yang direncanakan dalam zona B2 yaitu tinggi timbunan 4 meter. Timbunan ini dikerjakan dalam 8 tahap seperti terlihat pada **Tabel 5.17**. Apabila dalam proses penimbunan terdapat tahap timbunan yang tidak aman, kita bisa melakukan proses menunggu kenaikan  $C_u$  selama 16 minggu karena lama maksimal perencanaan adalah 24 minggu.

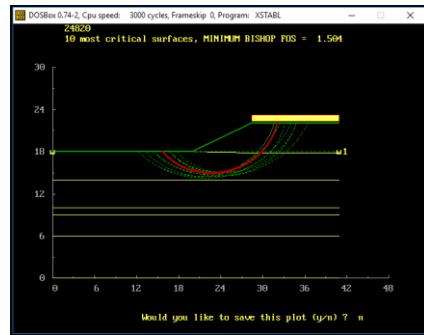

**Tabel 5.19** Tahap Penimbunan B2  $H_{final}$  4 meter

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,6      |
| 8     | 0,6      |
| Total | 4,2      |

SF tiap tahap timbunan yang didapatkan dari program bantu XSTABL direkap dalam **Tabel 5.18**. Selama proses penimbunan tidak ada tahap yang memiliki SF kurang dari 1,25. Artinya selama penimbunan tidak perlu ada proses menunggu. Pada tahap terakhir tahap 8 di minggu ke 16 ketika U90% kita mendapatkan SF masih kurang dari 1,5 (**Gambar 5.16**). Namun dengan proses menunggu hingga 4 minggu, kita mendapatkan SF sudah lebih dari 1,5 (**Gambar 5.17**) artinya tidak perlu ada perencanaan perkuatan lereng.

**Gambar 5.16** SF Tahap 8 Minggu 16 Zona B2 H<sub>final</sub> 4 meter

**Gambar 5.17** SF Tahap 8 Minggu 20 Zona B2 H<sub>final</sub> 4 meter

**Tabel 5.20** Rekap SF Tiap Tahap Zona B2 H<sub>final</sub> 4 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 7,612 |
| 2                | 2     | 3,961 |
| 3                | 3     | 2,818 |
| 4                | 4     | 2,279 |
| 5                | 5     | 1,94  |
| 6                | 6     | 1,778 |
| 7                | 7     | 1,615 |
| 8                | 8     | 1,498 |
| Minggu 16 (U90%) |       | 1,485 |
| 17               | 8     | 1,49  |
| 18               | 8     | 1,495 |
| 19               | 8     | 1,499 |
| 20               | 8     | 1,504 |

#### 5.4.6 SF pada Zona B27 $H_{final}$ 8 meter

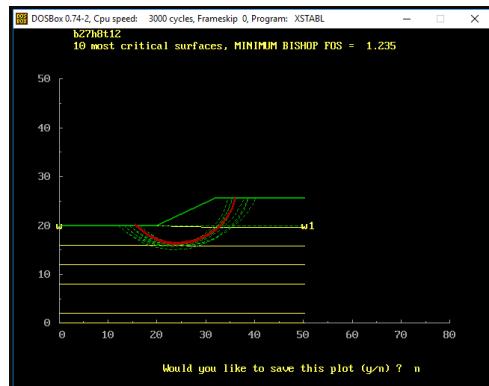

Zona berikutnya zona B27 memiliki 2 tinggi timbunan yang akan direncanakan yaitu 8 meter dan 5 meter. Timbunan 8 meter yang akan dibahas ini dikerjakan dalam 18 tahap. Dengan perencanaan maksimal 24 minggu, artinya kita dapat melakukan proses menunggu kenaikan  $C_u$  selama 6 minggu. Apabila menunggu kenaikan  $C_u$  butuh waktu lebih dari itu, maka cara tersebut tidak bisa dilakukan dan wajib diberi perkuatan lereng pada SF paling kecil. Tahap penimbunan dapat dilihat pada **Tabel 5.19.**

**Tabel 5.21** Tahap Penimbunan B27  $H_{final}$  8 meter

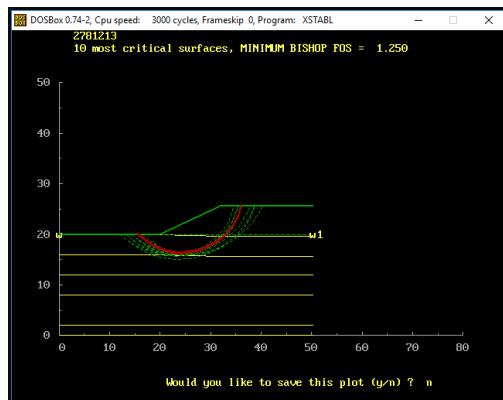

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,5      |
| 8     | 0,5      |
| 9     | 0,5      |
| 10    | 0,5      |
| 11    | 0,5      |
| 12    | 0,5      |
| 13    | 0,5      |
| 14    | 0,5      |
| 15    | 0,5      |
| 16    | 0,5      |
| 17    | 0,5      |
| 18    | 0,4      |
| Total | 8,9      |

Berdasarkan hasil SF yang didapat dari program bantu, kita menemukan bahwa pada tahap ke-12 SF kurang dari 1,25 (**Gambar 5.18**), artinya perlu dilakukan proses menunggu. Tahap 12 hanya perlu menunggu 1 minggu untuk mencapai SF lebih dari 1,25 (**Gambar 5.19**), namun pada tahap 13 pun SF tidak aman (**Gambar 5.20**) dan perlu dilakukan proses menunggu selama 2 minggu (**Gambar 5.21**). Tahap 14 yang baru ditimbun pada minggu ke-17 ternyata juga memiliki SF kurang dari 1,25 (**Gambar 5.22**), oleh karenanya perlu ditunggu kenaikan  $C_u$  selama 1 minggu (**Gambar 5.23**). Tahap 15 yang ditimbun di

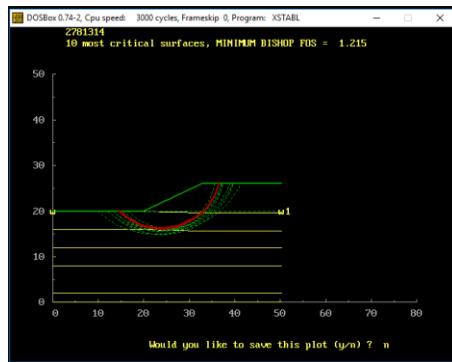

minggu 19 memiliki SF yang aman jadi penimbunan bisa dilanjutkan tanpa perlu menunggu, namun SF pada tahap 16 di minggu 20 kurang dari 1,25 (**Gambar 5.24**). Proses menunggu untuk tahap 16 memerlukan waktu 2 minggu hingga mencapai SF aman (**Gambar 5.25**). Pada tahap penimbunan 17 lagi lagi SF kurang dari 1,25 (**Gambar 5.26**).

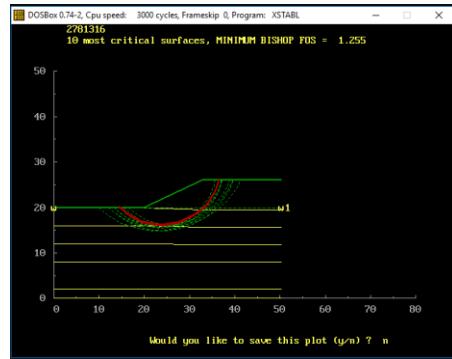

**Gambar 5.18** SF Tahap 12 Minggu 12 Zona B27 H<sub>final</sub> 8 meter

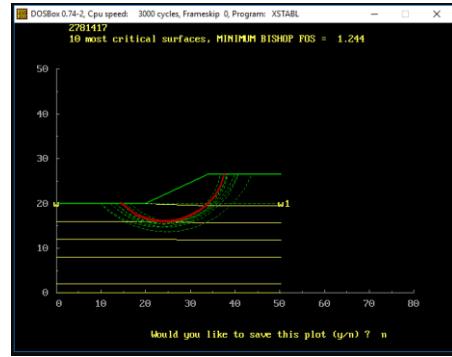

**Gambar 5.19** SF Tahap 12 Minggu 13 Zona B27 H<sub>final</sub> 8 meter

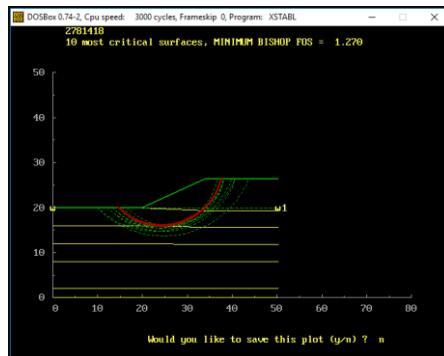

**Gambar 5.20** SF Tahap 13 Minggu 14 Zona B27 H<sub>final</sub> 8 meter

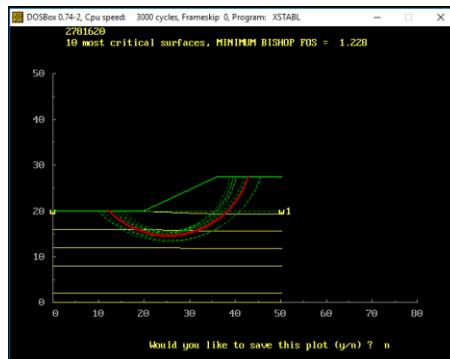

**Gambar 5.21** SF Tahap 13 Minggu 16 Zona B27 H<sub>final</sub> 8 meter

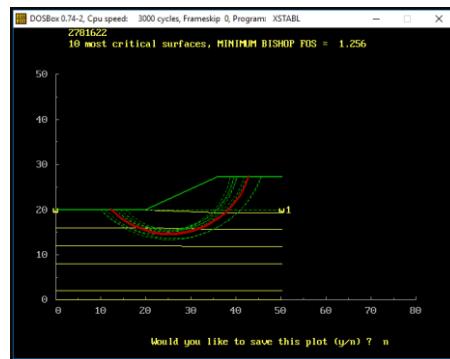

**Gambar 5.22** SF Tahap 14 Minggu 17 Zona B27 H<sub>final</sub> 8 meter

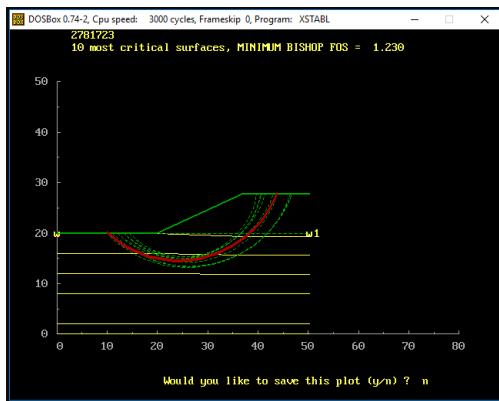

**Gambar 5.23** SF Tahap 14 Minggu 18 Zona B27  $H_{\text{final}}$  8 meter

**Gambar 5.24** SF Tahap 16 Minggu 20 Zona B27  $H_{\text{final}}$  8 meter

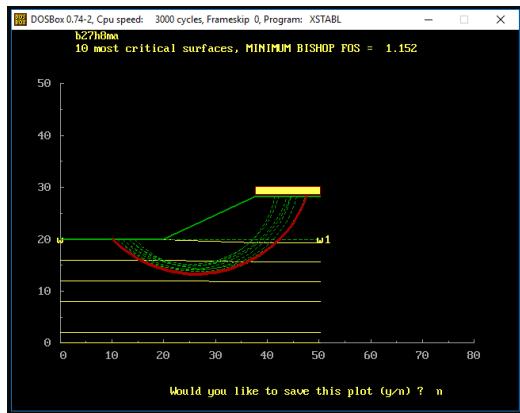

**Gambar 5.25** SF Tahap 16 Minggu 22 Zona B27  $H_{\text{final}}$  8 meter

**Gambar 5.26** SF Tahap 17 Minggu 23 Zona B27  $H_{final}$  8 meter

Zona B2  $H_{final}$  8 meter tidak bisa menggunakan cara menunggu kenaikan  $C_u$  karena waktu yang diperlukan untuk mencapai SF aman lebih dari 6 minggu. Tahap 12 memerlukan 1 minggu, tahap 13 perlu 2 minggu, tahap 14 perlu 1 minggu, dan tahap 16 perlu 2 minggu. Jadi ketika tahap 17 yang dikerjakan di minggu ke 23 memiliki SF kurang dari 1,25 penimbunan tidak bisa dilanjutkan karena dikhawatirkan terjadi longsor, sedangkan menunggu kenaikan  $C_u$  tidak bisa lagi dilakukan karena jadwal maksimal perencanaan yaitu 24 minggu. Oleh karena itu kita memerlukan perencanaan perkuatan lereng.

Perencanaan untuk perkuatan lereng akan dihitung menggunakan SF paling rendah yaitu pada tahap terakhir tahap 18 di minggu 22 ketika U mencapai 90% seperti terlihat pada **Gambar 5.27**. Rekap hasil SF dari tiap tahap penimbunan terdapat pada **Tabel 5.20** dan untuk lebih lengkapnya tercantum pada Lampiran 3.

**Gambar 5.27** SF Tahap 18 Minggu 22 Zona B27 H<sub>final</sub> 8 meter

**Tabel 5.22** Rekap SF Tiap Tahap Zona B27 H<sub>final</sub> 8 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 7,248 |
| 2                | 2     | 3,763 |
| 3                | 3     | 2,693 |
| 4                | 4     | 2,216 |
| 5                | 5     | 1,864 |
| 6                | 6     | 1,64  |
| 7                | 7     | 1,518 |
| 8                | 8     | 1,426 |
| 9                | 9     | 1,347 |
| 10               | 10    | 1,307 |
| 11               | 11    | 1,259 |
| 12               | 12    | 1,235 |
| 13               | 12    | 1,25  |
| 14               | 13    | 1,215 |
| 15               | 13    | 1,245 |
| 16               | 13    | 1,255 |
| 17               | 14    | 1,244 |
| 18               | 14    | 1,27  |
| 19               | 15    | 1,251 |
| 20               | 16    | 1,228 |
| 21               | 16    | 1,236 |
| 22               | 16    | 1,256 |
| 23               | 17    | 1,23  |
| Minggu 22 (U90%) |       | 1,152 |

#### 5.4.7 SF pada Zona B27 $H_{final}$ 5 meter

Timbunan tinggi 5 meter pada zona B27 dikerjakan dalam 12 tahap penimbunan seperti pada **Tabel 5.21**. Apabila dalam tahap penimbunan terdapat SF kurang dari 1,25 kita dapat melakukan proses menunggu kenaikan  $C_u$  maksimal selama 12 minggu karena perencanaan tidak boleh lebih dari 24 minggu.

**Tabel 5.23** Tahap Penimbunan B27  $H_{final}$  5 meter

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,5      |
| 8     | 0,5      |
| 9     | 0,5      |
| 10    | 0,4      |
| 11    | 0,4      |
| 12    | 0,4      |
| Total | 5,7      |

Hasil program bantu XSTABL menunjukkan bahwa SF pada tiap tahap penimbunan lebih dari 1,25 seperti terlihat pada **Tabel 5.22**. Artinya semua tahap penimbunan bisa dikerjakan secara langsung tanpa perlu menunggu, namun kita tetap memerlukan perkuatan untuk lereng timbunan karena pada tahap terakhir yaitu tahap 12 SF masih kurang dari 1,5. Perencanaan perkuatan lereng timbunan akan menggunakan SF pada tahap penimbunan ke-12 dan pada minggu ke 21 ketika U90% (**Gambar 5.28**).

**Gambar 5.28** SF Tahap 12 Minggu 21 Zona B27 H<sub>final</sub> 5 meter

**Tabel 5.24** Rekap SF Tiap Tahap Zona B27 H<sub>final</sub> 5 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 7,248 |
| 2                | 2     | 3,763 |
| 3                | 3     | 2,693 |
| 4                | 4     | 2,216 |
| 5                | 5     | 1,864 |
| 6                | 6     | 1,64  |
| 7                | 7     | 1,531 |
| 8                | 8     | 1,427 |
| 9                | 9     | 1,347 |
| 10               | 10    | 1,322 |
| 11               | 11    | 1,285 |
| 12               | 12    | 1,271 |
| Minggu 21 (U90%) |       | 1,318 |

#### 5.4.8 SF pada Zona B30 H<sub>final</sub> 4 meter

Zona terakhir yaitu zona B30 yang memiliki tinggi timbunan rencana 4 meter. Timbunan ini dikerjakan dalam 9 tahap penimbunan. Proses menunggu kenaikan C<sub>u</sub> dapat dilakukan maksimal selama 15 minggu karena perencanaan timbunan tidak boleh lebih dari 24 minggu. Tahap penimbunan dapat dilihat pada **Tabel 5.23**.

**Tabel 5.25** Tahap Penimbunan B30 H<sub>final</sub> 4 meter

| Tahap | H<br>(m) |
|-------|----------|
| 1     | 0,5      |
| 2     | 0,5      |
| 3     | 0,5      |
| 4     | 0,5      |
| 5     | 0,5      |
| 6     | 0,5      |
| 7     | 0,5      |
| 8     | 0,5      |
| 9     | 0,5      |
| Total | 4,5      |

*Safety factor* yang didapatkan melalui XSTABL pada tiap tahap penimbunan lebih dari 1,25, artinya ketika tahap penimbunan tidak perlu proses menunggu dan bisa langsung dikerjakan tiap minggunya. Namun ketika semua tahap penimbunan selesai SF yang didapatkan masih kurang dari 1,5, oleh karenanya memerlukan perencanaan perkuatan lereng. SF yang digunakan untuk perencanaan yaitu SF pada tahap terakhir di minggu 24 ketika U mencapai 90% seperti pada **Gambar 5.29**. Rekap SF yang didapat dari tiap tahap penimbunan dapat dilihat pada **Tabel 5.24**.

**Gambar 5.29** SF Tahap 9 Minggu 24 Zona B30 H<sub>final</sub> 4 meter

**Tabel 5.26** Rekap SF Tiap Tahap Zona B30 H<sub>final</sub> 4 meter

| Hasil XSTABL     |       |       |
|------------------|-------|-------|
| Minggu           | Tahap | SF    |
| 1                | 1     | 9,295 |
| 2                | 2     | 4,611 |
| 3                | 3     | 3,201 |
| 4                | 4     | 2,591 |
| 5                | 5     | 2,233 |
| 6                | 6     | 1,938 |
| 7                | 7     | 1,732 |
| 8                | 8     | 1,616 |
| 9                | 9     | 1,493 |
| Minggu 24 (U90%) |       | 1,49  |

#### 5.4.9 Rekap Analisa Stabilitas Timbunan

Hasil analisa kuat lereng yang dilakukan pada sub bab sebelumnya memiliki hasil yang berbeda-beda tergantung pada zona dan variasi tinggi timbunan. Untuk mempermudah dan memperjelas dalam membaca akan dijadikan dalam suatu rekapan seperti terlihat pada **Tabel 5.27**.

**Tabel 5.27** Rekapitulasi Hasil Analisa Stabilitas Timbunan

| Zona & Tinggi Timbunan | Hasil Analisa Stabilitas Lereng   |
|------------------------|---|
| Zona B1 Hfinal 4 m     | SF tiap tahap > 1,25, SF tahap akhir + beban surcharge > 1,5, tidak memerlukan perkuatan  |
| Zona B1 Hfinal 7 m     | tahap 15 ditunggu 2 minggu untuk kenaikan Cu sebelum menimbun tahap 16, tetapi memerlukan perkuatan karena SF di tahap terakhir + beban surcharge < 1,5 |
| Zona B1 Hfinal 10 m    | tidak bisa menggunakan cara menunggu kenaikan Cu karena melewati batas waktu perencanaan 24 minggu, memerlukan perkuatan                                |
| Zona B2 Hfinal 4 m     | tahap akhir ditunggu 4 minggu, SF > 1,5, tidak memerlukan perkuatan   |
| Zona B2 Hfinal 9 m     | SF tiap tahap > 1,25, SF tahap akhir + beban surcharge < 1,5, memerlukan perkuatan  |
| Zona B27 Hfinal 5 m    | SF tiap tahap > 1,25, SF tahap akhir + beban surcharge < 1,5, memerlukan perkuatan  |
| Zona B27 Hfinal 8 m    | tidak bisa menggunakan cara menunggu kenaikan Cu karena melewati batas waktu perencanaan 24 minggu, memerlukan perkuatan                                |
| Zona B30 Hfinal 4 m    | SF tiap tahap > 1,25, SF tahap akhir + beban surcharge < 1,5, memerlukan perkuatan  |

## 5.5 Perencanaan Perkuatan Lereng Timbunan

Perkuatan pada lereng timbunan perlu dilakukan apabila peningkatan  $C_u$  dari tanah asli yang terjadi akibat beban timbunan tidak dapat menahan terjadinya longsor. Ada beberapa alternatif yang akan coba dilakukan yaitu *Geotextile*, *Micropile* / Cerucuk, dan kombinasi dari keduanya. Masing-masing membutuhkan kebutuhan biaya berbeda-beda, oleh karenanya akan dihitung dan dicari yang termurah.

### 5.5.1 Alternatif Perencanaan Perkuatan *Geotextile*

Perhitungan *geotextile* sebagai perkuatan lereng timbunan membutuhkan hasil dari program bantu yaitu SF dan *Resisting Momen*. Contoh perencanaan yang ditulis adalah Zona B1  $H_{final}$  10 meter pada tahap 22 minggu 23. Di dalam program bantu nantinya akan dicari SF 10x dengan titik yang berbeda-beda agar perhitungan lebih *valid*. Hasil dari XSTABL dapat dilihat pada **Tabel 5.25**.

**Tabel 5.28** Hasil XSTABL Zona B1  $H_{final}$  10 meter

| No | SF    | Hasil XSTABL |              |             |       | Perhitungan |               |               |                       |
|----|-------|--------------|--------------|-------------|-------|-------------|---------------|---------------|-----------------------|
|    |       | MR<br>(kN.m) | MD<br>(kN.m) | titik pusat |       | R<br>m      | SF<br>rencana | MR<br>rencana | $\Delta$ MR<br>(kN.m) |
| 1  | 1,135 | 25420        | 22396,48     | 25,98       | 37,27 | 19,28       | 1,5           | 33594,71      | 8174,714              |
| 2  | 1,114 | 29090        | 26113,11     | 27,4        | 38,25 | 20,26       | 1,5           | 39169,66      | 10079,66              |
| 3  | 1,117 | 30320        | 27144,14     | 28,1        | 38,61 | 20,54       | 1,5           | 40716,2       | 10396,2               |
| 4  | 1,153 | 23140        | 20069,38     | 27,05       | 36,46 | 18,04       | 1,5           | 30104,08      | 6964,076              |
| 5  | 1,128 | 28150        | 24955,67     | 28,98       | 37,27 | 19,28       | 1,5           | 37433,51      | 9283,511              |
| 6  | 1,119 | 29330        | 26210,9      | 28,63       | 37,8  | 19,87       | 1,5           | 39316,35      | 9986,354              |
| 7  | 1,206 | 20290        | 16824,21     | 28,78       | 35,18 | 16,24       | 1,5           | 25236,32      | 4946,318              |
| 8  | 1,174 | 25820        | 21993,19     | 30,05       | 36,46 | 18,04       | 1,5           | 32989,78      | 7169,779              |
| 9  | 1,184 | 30910        | 26106,42     | 30,69       | 38,48 | 19,93       | 1,5           | 39159,63      | 8249,628              |
| 10 | 1,123 | 32230        | 28699,91     | 26,96       | 40,1  | 21,83       | 1,5           | 43049,87      | 10819,87              |

Berikut contoh perhitungan perencanaan *geotextile* saat  $H_{final}$  dengan SF 1,135 :

1. Perhitungan kuat tarik ijin

*Geotextile* :  $T_{ult} = 52 \text{ kN/m}$

$$T_{allow} = \frac{52}{1,1 \times 2 \times 1 \times 1}$$

$$T_{allow} = 23,636 \text{ kN/m}$$

2. Perhitungan momen penahan rencana

$$SF \text{ rencana} = 1,5$$

$$MR \text{ rencana} = SF_{\text{rencana}} * MD = 33594,71 \text{ kNm}$$

$$\Delta MR = 33594,71 - 22396,48 = 8174,714 \text{ kNm}$$

3. Perhitungan panjang *geotextile* di belakang bidang longsor (Le). Perhitungan Le dilakukan tiap lapisan. Berikut contoh perhitungan Le :

Pada  $z = 0$  m dan  $Sv = 0,25$  m dengan  $SF \text{ rencana} = 1,5$

$$\text{diperoleh: } Le = \frac{23,636 \times 1,5}{((113,103 + 40,222) \times 0,8)}$$

$$Le = 0,289 \text{ meter}$$

Dipakai  $Le \text{ min} = 1$  meter

4. Perhitungan panjang *geotextile* di depan bidang longsor (Lr) menggunakan rumus

$$L_R = (10,9 - 0) \times \operatorname{tg} (45 - \frac{30}{2})$$

$$L_R = 6,3 \text{ m}$$

5. Perhitungan panjang lipatan *geotextile* (Lo) adalah  $0,5Le$ , karena Le lebih kecil dari 1 maka  $Lo = 1$  m.

6. Panjang total *geotextile* per lapis

$$L_{\text{total}} = Le + L_R + Lo + Sv$$

$$L_{\text{total}} = 1 + 6,3 + 1 + 0,25 = 8,55 \text{ m} = 9 \text{ m}$$

7. Menghitung tambahan momen penahan akibat *geotextile*

$$MR = T_{\text{allow}} \times T_i \quad T_i : \text{jarak geotextile}$$

$$MR = 23,636 \times 13,27 \quad \text{dengan pusat bidang longsor}$$

$$MR = 313,65 \text{ kNm}$$

Hasil perhitungan kebutuhan *geotextile* antara lain panjang total, jumlah lapis, dan rekap dari masing-masing SF disajikan dalam tabel-tabel berikut ini. Untuk perhitungan zona lain dan tinggi timbunan rencana lain terdapat di Lampiran 3.

### 5.5.2 Alternatif Perencanaan Perkuatan *Micropile / Cerucuk*

Pada alternatif perkuatan ini dibutuhkan hasil analisa program bantu XSTABL yaitu SF, *resisting moment*, jari-jari kelongsoran, serta koordinat kelongsoran dengan kondisi paling kritis. Contoh perhitungan dilakukan pada Zona B1  $H_{final}$  10 meter dengan SF 1,135. Perhitungan zona maupun tinggi rencana lain sudah dirangkum dalam tabel pada Lampiran 3.

Rencana cerucuk yang digunakan :

$$D = 30\text{cm}$$

$$\text{Class} = C$$

$$M_{crack} = 4 \text{ t/m}$$

$$E = 315286 \text{ kg/cm}^2$$

$$I = 34607,8 \text{ cm}^4$$

- Menghitung Gaya Penahan (*Resisting*)

Faktor modulus tanah (f)

$C_u$  = Tahanan geser tanah asli

$C_u$  (pada garis longsor) =  $0,153 \text{ kg/cm}^2$

$$q_u = 2 \times C_u$$

$$= 2 \times 0,153 \text{ kg/cm}^2$$

$$= 0,306 \text{ kg/cm}^2$$

dengan Grafik NAVFAC, DM-7, 1971 seperti yang ditampilkan pada BAB 2, maka didapat:  
 $f = 0,128 \text{ kg/cm}^3$

direncanakan :

|     |  |
|-----|--|
| L   | = 2 m di bawah garis longsor                       |
| T   | = $(EI/f)^{0.2}$                                   |
| T   | = 153,509 cm T : faktor kekakuan relatif           |
| L/T | = 1,303  |
| FM  | = 1 (grafik)                                       |
| P   | = M crack/ FM.T                                    |
| P   | = 2605,71 kg = 26,06 kN                            |
| n   | = $(SF_{rencana} - SF) * MD / (PxR)$               |
| n   | = $(1,5 - 1,135) * 22396,5 / (26,06 \times 19,28)$ |
| n   | = 17 cerucuk                                       |

**Tabel 5.32** Rekap Kebutuhan Cerucuk Zona B1  $H_{final}$  10 meter

| SF XSTABL | Jumlah Cerucuk |
|-----------|----------------|
|           | Batang         |
| 1,135     | 34             |
| 1,114     | 40             |
| 1,117     | 40             |
| 1,153     | 30             |
| 1,128     | 38             |
| 1,119     | 40             |
| 1,206     | 24             |
| 1,174     | 32             |
| 1,184     | 32             |
| 1,123     | 40             |

### 5.5.3 Alternatif Perencanaan Perkuatan Kombinasi

Alternatif perkuatan lereng timbunan selanjutnya adalah kombinasi dari *Geotextile* dan *Micropile*. Masih sama dengan dua perencanaan sebelumnya, tetapi membutuhkan hasil analisa dari program bantu XSTABL untuk mendapatkan SF, *resisting moment*, jari-jari kelongsoran, dan koordinat longsor paling kritis. Proses perhitungan perencanaan juga sama untuk masing-masing perkuatan hanya saja selisih antara momen penahan rencana (SF 1,5) dengan momen penahan aktual akan dibagi bobotnya kepada *Geotextile* 70% dan *Micropile* 30%.

Berikut contoh perhitungan perencanaan kombinasi saat  $H_{final}$  dengan SF 1,135 :

1. Membagi  $\Delta MR$ , direkap dalam **Tabel 5.30**

$$SF \text{ rencana} = 1,5$$

$$MR \text{ rencana} = SF \text{ rencana} * MD = 33594,7 \text{ kNm}$$

$$\Delta MR = 33594,7 - 25420 = 8174,7 \text{ kNm}$$

$$0,7 \Delta MR = 0,7 \times 8175 = 5722,3 \text{ kNm} (\textit{Geotextile})$$

$$0,3 \Delta MR = 0,3 \times 8175 = 2452,4 \text{ kNm} (\textit{Micropile})$$

**Tabel 5.33** Pembagian  $\Delta MR$  untuk Perkuatan Kombinasi

| No | SF    | Hasil XSTABL |              |             |       | Perhitungan |               |               |                    |                    |

| 7  | 1,206 | 20290        | 16824,21     | 28,78       | 35,18 | 16,24       | 1,5           | 25236,32      | 3462,423           | 1483,896           |
| 8  | 1,174 | 25820        | 21993,19     | 30,05       | 36,46 | 18,04       | 1,5           | 32989,78      | 5018,845           | 2150,934           |
| 9  | 1,184 | 30910        | 26106,42     | 30,69       | 38,48 | 19,93       | 1,5           | 39159,63      | 5774,74            | 2474,889           |
| 10 | 1,123 | 32230        | 28699,91     | 26,96       | 40,1  | 21,83       | 1,5           | 43049,87      | 7573,907           | 3245,96            |

2. MR rencana yang dibutuhkan untuk *Geotextile*

$$MR \text{ rencana} = MR + 0,7 \Delta MR$$

$$MR \text{ rencana} = 25420 + 5722,3$$

$$MR \text{ rencana} = 31142,3 \text{ kNm}$$

3. Perhitungan  $T_{allow}$ ,  $Le$ ,  $Lr$ , dan  $Lo$  dikerjakan dengan cara yang sama seperti dijelaskan di sub bab sebelumnya. Perhitungan dilakukan hingga mencapai  $\Delta MR$  lebih dari 5722,3 kNm dan momen tahan lebih dari 31142,3 kNm seperti terlihat pada **Tabel 5.31** dan **Tabel 5.32**.

**Tabel 5.34** Perhitungan Kebutuhan *Geotextile* dalam Perkuatan Kombinasi Zona B1  $H_{final}$  10 meter SF 1,135

| 9  | 8,88         | 11,27 | 159,8994          | 92,318            | 92,318            | 1,000 | 0,120 | 0,5          | 5,1  | 7,00        | 14                            |
| 10 | 8,63         | 11,02 | 155,3994          | 89,720            | 89,720            | 1,000 | 0,123 | 0,5          | 5,0  | 7,00        | 14                            |

Pada perkuatan kombinasi, *Geotextile* yang dibutuhkan sebanyak 40 lapis dan panjang total 336 meter (dua sisi).

4. Perhitungan *Micropile* juga sama seperti dijelaskan pada sub bab sebelumnya, yang membedakan hanya  $\Delta MR$  yang digunakan untuk mencari n tiang adalah 0,3  $\Delta MR = 2452,4 \text{ kNm}$ .

$$\begin{aligned} n &= \Delta MR / (P \times R) \\ n &= 2452,4 / (26,06 \times 19,28) \\ n &= 4,881 = 5 \text{ cerucuk} \end{aligned}$$

5. Perkuatan kombinasi untuk Zona B1  $H_{final}$  SF 1,135 membutuhkan *Geotextile* 40 lapis dan *Micropile* 10 tiang (2 sisi lereng timbunan). SF baru yang terjadi ketika menggunakan perkuatan kombinasi dapat dihitung dengan cara sebagai berikut :

$$\begin{aligned} \Delta MR_{micropile} &= n \times P \times R \\ \Delta MR_{micropile} &= 5 \times 26,06 \times 19,28 \\ \Delta MR_{micropile} &= 2512,18 \text{ kNm} \end{aligned}$$

$$\Delta MR_{geotextile} = 5741,27 \text{ kNm}$$

$$\begin{aligned} SF &= (MR + \Delta MR_{geotextile} + \Delta MR_{micropile}) / MD \\ SF &= (25420 + 5741,27 + 2512,18) / 22396 \\ SF &= 1,50355 > 1,5 \text{ (OK!)} \end{aligned}$$

Rekap kebutuhan *geotextile* dan cerucuk untuk perkuatan kombinasi dapat dilihat pada **Tabel 5.32**. Kebutuhan yang dituliskan adalah kebutuhan untuk 2 sisi lereng timbunan dan hanya per 1 meter lari. Perhitungan kombinasi untuk zona lain dirangkum dalam tabel yang terdapat pada Lampiran 3.

**Tabel 5.36** Rekap Kebutuhan *Geotextile* & Cerucuk pada Perencanaan Perkuatan Kombinasi Zona B1  $H_{final}$  10 meter

| SF XSTABL | Jumlah     |         |
|-----------|------------|---------|
|           | Geotextile | Cerucuk |
|           | Lapis      | Batang  |
| 1,135     | 40         | 10      |

| 1,123     | 44         | 12      |

## 5.6 Perbandingan Biaya Alternatif Perkuatan Lereng

Biaya untuk masing-masing perkuatan dihitung berdasarkan harga yang didapat dari brosur dan hanya dihitung per satu meter lari. Tiap alternatif perkuatan akan dibandingkan untuk mencari biaya termurah.

Perhitungan untuk perkuatan *geotextile* hanya perlu mengalikan kebutuhan panjang dengan harga *geotextile*, dan untuk perkuatan *micropile* yang dikalikan adalah jumlah kebutuhan tiang dengan harga *micropile*. Rekap perhitungan biaya untuk masing masing perkuatan tersaji pada tabel-tabel berikut ini.

**Tabel 5.37** Perhitungan Biaya Perkuatan *Geotextile* Zona B1  $H_{final}$  10 meter

| SF XSTABL | Kebutuhan Geotextile |             | Harga    | Total Biaya  |
|-----------|----------------------|-------------|----------|--------------|
|           | Lapis                | Panjang (m) |          |              |
| 1,135     | 60                   | 456         | Rp17.000 | Rp 7.752.000 |
| 1,114     | 72                   | 528         | Rp17.000 | Rp 8.976.000 |
| 1,117     | 72                   | 528         | Rp17.000 | Rp 8.976.000 |
| 1,153     | 56                   | 428         | Rp17.000 | Rp 7.276.000 |
| 1,128     | 72                   | 528         | Rp17.000 | Rp 8.976.000 |
| 1,119     | 76                   | 552         | Rp17.000 | Rp 9.384.000 |
| 1,206     | 44                   | 344         | Rp17.000 | Rp 5.848.000 |
| 1,174     | 56                   | 428         | Rp17.000 | Rp 7.276.000 |
| 1,184     | 56                   | 428         | Rp17.000 | Rp 7.276.000 |
| 1,123     | 68                   | 504         | Rp17.000 | Rp 8.568.000 |

| 1,114     | 48                   | 372         | Rp 6.324.000               | 12                  | 9           | Rp 32.400.000             | Rp 38.724.000         |
| 1,117     | 48                   | 372         | Rp 6.324.000               | 12                  | 8           | Rp 32.400.000             | Rp 38.724.000         |
| 1,153     | 36                   | 288         | Rp 4.896.000               | 10                  | 8           | Rp 27.000.000             | Rp 31.896.000         |
| 1,128     | 48                   | 372         | Rp 6.324.000               | 12                  | 9           | Rp 32.400.000             | Rp 38.724.000         |
| 1,119     | 48                   | 372         | Rp 6.324.000               | 12                  | 9           | Rp 32.400.000             | Rp 38.724.000         |
| 1,206     | 32                   | 260         | Rp 4.420.000               | 8                   | 8           | Rp 21.600.000             | Rp 26.020.000         |
| 1,174     | 40                   | 316         | Rp 5.372.000               | 10                  | 8           | Rp 27.000.000             | Rp 32.372.000         |
| 1,184     | 40                   | 316         | Rp 5.372.000               | 10                  | 8           | Rp 27.000.000             | Rp 32.372.000         |
| 1,123     | 44                   | 344         | Rp 5.848.000               | 12                  | 8           | Rp 32.400.000             | Rp 38.248.000         |

Pada Zona B1  $H_{final}$  SF 1,135 untuk perkuatan *geotextile* membutuhkan 60 lapis dengan panjang 480 meter dan biaya sebesar Rp 8.160.000 per meter lari. Perkuatan *micropile* membutuhkan 34 tiang dengan panjang 9 meter dan total biaya Rp 91.800.000 per meter lari. Perkuatan kombinasi membutuhkan *geotextile* 40 lapis dengan total panjang 336 meter dan *micropile* 10 tiang sedalam 9 meter, total biaya sebesar Rp 32.712.000.

Melalui contoh perhitungan biaya pada zona B1  $H_{final}$  10 meter, kita mendapatkan bahwa biaya perkuatan *geotextile* lebih murah dibandingkan biaya perkuatan yang lain. Tabel

perhitungan kebutuhan biaya dari masing-masing perkuatan pada zona lain dapat ditemukan di Lampiran 3.

### 5.7 Rekap Perencanaan Perbaikan Tanah dan Perkuatan Lereng

Perhitungan yang dilakukan di sub bab sebelumnya akan dikerjakan untuk semua zona dan tinggi timbunan. Hasil dari perhitungan di semua STA akan dirangkum dalam tabel berikut.

**Tabel 5.40** Rekap Perencanaan *Section 28*

| Zona | STA    | Hfinal | Hinitial | Sc  | Kedalaman PVD | Pola Pemasangan PVD | Geotextile | Cerucuk | Kombinasi Geotextile & Cerucuk |
|------|--------|--------|----------|-----|---------------|---------------------|------------|---------|--------------------------------|
|      |        | (m)    | (m)      | (m) | (m)           |                     | (lapis)    | (tiang) | (lapis geotextile)             |
| B1   | 28+600 | 2,69   | 3,0      | 0,4 | 7             | Segitiga 2,25 m     |            |         |                                |

### 5.7.1 Perhitungan Biaya PVD

Jumlah PVD yang dibutuhkan bisa dicari dengan cara membagi lebar timbunan bawah dikalikan dengan panjang jalan tiap 50 meter lalu dibagi dengan luas area tiap PVD. Perhitungan biaya yang dibutuhkan untuk PVD pada masing-masing STA dapat dihitung dengan mengalikan jumlah PVD dengan panjang PVD pada STA tersebut dan dikalikan dengan harga PVD per meter. Total biaya PVD yang dibutuhkan untuk section 28 adalah Rp 268.164.629,- dan untuk section 41 membutuhkan biaya sebesar Rp 384.826.508,-. Rekap biaya PVD dari semua STA dapat dilihat pada tabel berikut.

**Tabel 5.42** Rekap Kebutuhan Biaya PVD Section 28

| Zona | STA    | Hfinal | Hinitial | Kedalaman PVD | Pola Pemasangan PVD | Jumlah Titik PVD | Panjang PVD | Harga PVD (/m) | Total Biaya Rupiah |

### 5.7.2 Perhitungan Biaya Perkuatan Geotextile

Pada sub bab sebelumnya sudah dijelaskan cara menghitung kebutuhan *geotextile*, dan dari 10 variasi SF yang dikerjakan akan dipilih yang membutuhkan *geotextile* paling banyak dan paling panjang. Hasil perhitungan kebutuhan dan biaya *geotextile* pada *section* 28 sebesar Rp 2.655.400.000,- dan untuk *section* 41 membutuhkan biaya sebesar Rp 3.881.100.000,-.

**Tabel 5.44 Rekap Kebutuhan Biaya Geotextile Section 28**

| Zona | STA    | Kebutuhan Geotextile |             | Panjang Jalan<br>(m) | Harga<br>Rupiah | Total Biaya<br>Rupiah |
|------|--------|----------------------|-------------|----------------------|-----------------|-----------------------|
|      |        | Lapis                | Panjang (m) |                      |                 |                       |

### 5.7.3 Perhitungan Biaya Perkuatan *Micropile / Cerucuk*

Sama halnya dengan *geotextile*, pada perkuatan cerucuk kita akan mengambil kebutuhan tiang cerucuk paling banyak dan paling panjang dari 10 variasi SF yang dikerjakan. Kebutuhan cerucuk dari masing-masing zona pada tiap STA akan dihitung biayanya dan dirangkum dalam tabel berikut. Total biaya perkuatan cerucuk pada *section 28* sebesar Rp 39.960.000.000,- dan pada *section 41* membutuhkan biaya sebesar Rp 62.100.000.000,-.

**Tabel 5.46** Rekap Kebutuhan Biaya *Micropile Section 28*

| Zona | STA    | Kebutuhan Micropile |             | Panjang Jalan<br>(m) | Harga<br>Rupiah | Total Biaya<br>Rupiah |
|------|--------|---------------------|-------------|----------------------|-----------------|-----------------------|
|      |        | Tiang               | Panjang (m) |                      |                 |                       |
| B1   | 28+600 |                     |             | 50                   |                 |                       |
|      | 28+650 | 20                  | 8           | 50                   | Rp 2.700.000,00 | Rp2.700.000.000       |

#### 5.7.4 Perhitungan Biaya Perkuatan Kombinasi

Pada alternatif perkuatan kombinasi *geotextile* dan *micropile* akan dipilih kebutuhan perkuatan yang paling banyak dari tiap zonanya. Biaya yang dibutuhkan untuk menggunakan alternatif perkuatan ini di *section 28* sebesar Rp 14.286.600.000,- dan pada *section 41* sebesar Rp 26.551.400.000,-. Untuk lebih detail dapat dilihat pada tabel berikut.

**Tabel 5.48 Rekap Biaya Perkuatan Kombinasi Section 28**

| Zona | STA    | Kebutuhan Geotextile |             | Kebutuhan Micropile |             | Panjang Jalan<br>(m) | Harga Geotextile<br>Rupiah | Harga Micropile<br>Rupiah | Total Biaya<br>Rupiah |
|------|--------|----------------------|-------------|---------------------|-------------|----------------------|----------------------------|---------------------------|-----------------------|

|      | 42+350 | 2                    | 10          | 2                   | 7           | 50                   | Rp17.000                   | Rp 2.700.000,00           | Rp278.500.000         |

### 5.7.5 Rangkuman Biaya

Total biaya yang dibutuhkan seluruh jalan yang ditinjau :

|                         |                        |
|-------------------------|------------------------|
| Harga PVD               | : Rp 652.991.137,-     |
| Harga <i>Geotextile</i> | : Rp 6.536.500.000,-   |
| Harga <i>Micropile</i>  | : Rp 102.060.000.000,- |
| Harga Kombinasi         | : Rp 40.838.000.000,-  |

Perkuatan lereng timbunan yang paling murah adalah *geotextile*. Biaya yang diperlukan apabila menggunakan perbaikan tanah PVD dan perkuatan lereng *geotextile* sebesar Rp 7.189.491.137,-.

## BAB VI

### KESIMPULAN DAN SARAN

#### 6.1 Kesimpulan

Dalam perencanaan Tugas Akhir ini didapatkan beberapa kesimpulan yaitu :

1. *Section 28* dibagi menjadi 2 zona, B1 STA 28+600 – STA 29+250 dan B2 STA 29+300 – STA 29+850. *Section 41* dibagi menjadi 2 zona, B27 STA 41+000 – STA 41+750 dan B30 STA 41+800 – STA 42+350.
2. Terdapat 3  $H_{initial}$  pada zona B1 yaitu 4,5 m, 7,8 m, dan 10,9 m. Pada zona B2 tinggi  $H_{initial}$  4,2 m dan 9,3 m. Zona B27 memiliki  $H_{initial}$  5,7 m dan 8,9 m, lalu zona B30 memiliki  $H_{initial}$  4,5 m.
3. Pola pemasangan PVD yang digunakan pada tiap STA sama yaitu Pola Segitiga dengan jarak 2,25 m. Kedalaman PVD beragam tergantung dari zona masing-masing, yang terpendek 4 m dan yang terpanjang 8 m.
4. Perencanaan perkuatan lereng menggunakan SF pada tahap penimbunan terakhir dan pada minggu dimana U mencapai 90%. Dari tiap zona dan variasi tinggi timbunan terdapat 2 zona yang tidak memerlukan perkuatan lereng timbunan yaitu zona B1 dengan  $H_{final}$  4 m dan zona B2 dengan  $H_{final}$  4 m. Jumlah kebutuhan masing-masing perkuatan pada tiap zona dan variasi tinggi timbunan dijadikan satu pada **Tabel 6.1**.

**Tabel 6.1** Jumlah Kebutuhan Perkuatan

| Zona & Tinggi Timbunan | Geotextile<br>(lapis) | Cerucuk<br>(tiang) | Kombinasi Geotextile & Cerucuk<br>(lapis geotextile) | (tiang cerucuk) |
|------------------------|-----------------------|--------------------|--|-----------------|
| Zona B1 Hfinal 4 m     | -                     | -                  | -  | -               |
| Zona B1 Hfinal 7 m     | 36                    | 20                 | 24   | 6               |

5. Total kebutuhan panjang masing-masing perkuatan lereng timbunan pada tiap zona dan variasi tinggi timbunan dapat dilihat pada **Tabel 6.2**.

**Tabel 6.2** Kebutuhan Panjang Tiap Perkuatan pada Tiap Zona

| Zona & Tinggi Timbunan | Geotextile (m) | Cerucuk (m) | Kombinasi Geotextile & Cerucuk (m) | Cerucuk (m) |
|------------------------|----------------|-------------|------------------------------------|-------------|
| Zona B1 Hfinal 4 m     | -              | -           | -                                  | -           |
| Zona B1 Hfinal 7 m     | 198            | 8           | 142                                | 8           |
| Zona B1 Hfinal 10 m    | 552            | 9           | 372                                | 9           |
| Zona B2 Hfinal 4 m     | -              | -           | -                                  | -           |
| Zona B2 Hfinal 9 m     | 208            | 6           | 150                                | 6           |
| Zona B27 Hfinal 5 m    | 62             | 7           | 52                                 | 7           |
| Zona B27 Hfinal 8 m    | 376            | 9           | 264                                | 9           |
| Zona B30 Hfinal 4 m    | 10             | 7           | 10                                 | 7           |

6. Biaya yang dibutuhkan ketika menggunakan PVD dan *geotextile* sebesar Rp 7.189.491.137,- , untuk PVD dan *micropile* butuh biaya Rp 102.712.991.137,- lalu untuk PVD dan perkuatan kombinasi sebesar Rp 41.490.991.137,-. Metode perbaikan tanah dan perkuatan lereng yang mempunyai biaya material paling murah adalah PVD dan *geotextile*.

## 6.2 Saran

Setelah dilakukan perhitungan dan analisa, penulis memberikan saran yaitu :

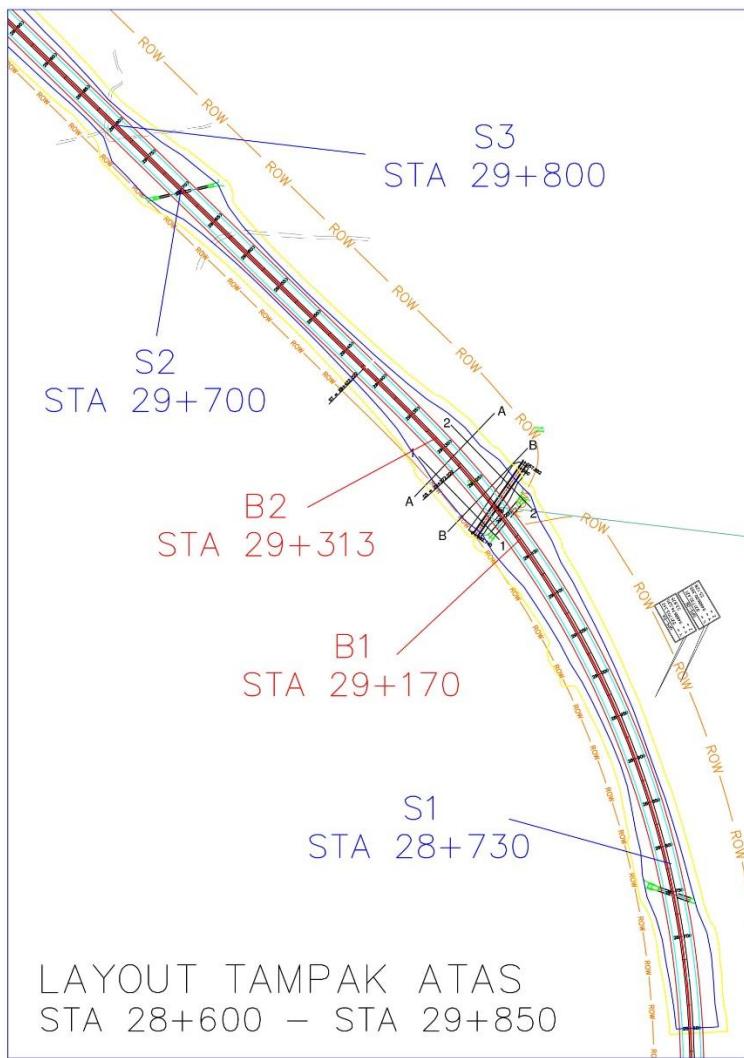

1. Perencanaan timbunan sebaiknya mempertimbangkan lokasi di sekitar.
2. Pada perhitungan biaya untuk perencanaan selanjutnya dapat diperhitungkan biaya pelaksanaan.

## LAMPIRAN 2

### Spesifikasi PVD

## CeTeau-Drain CT-D812

#### Drain Body

Extrusion profile of 100% polypropylene with the following important properties:

- environmental safe
- large water flow capacity
- flexible
- high tensile strength and toughness
- inert to natural occurring acids alkalis and salt
- workable and easy to handle at low temperatures
- no wet shrinkage or growth

#### Filter Jacket

Nonwoven fabric of 100% polyester without any binders, with the following important properties:

- balanced strength in both directions
- high tensile strength and toughness
- no wet shrinkage or growth
- good resistance to rot, moisture and insects
- high water permeability
- inert to natural occurring acids, alkalis and salt
- excellent filtration characteristics
- tear, burst and puncture resistant
- environmental safe

## BIODATA PENULIS

Penulis lahir di Surabaya, 21 April 1994, dengan nama lengkap Mohamad Prakoso Gagas Samodra. Penulis merupakan anak kedua dari 3 bersaudara. Penulis telah menempuh pendidikan formal di TK Al-Falah Surabaya, SDN Kendang Sari I No 276 Surabaya, SMPN 6 Surabaya, SMAN 5 Surabaya. Lalu penulis mengikuti Seleksi Nasional Masuk Perguruan Tinggi Negeri (SNMPTN) dan diterima di Jurusan S-1 Teknik Sipil FTSP-ITS pada tahun 2012 dan terdaftar dengan NRP 3112 100 075.

Dalam perkuliahan tidak banyak mata kuliah yang disukai oleh penulis, namun bidang studi Geoteknik menjadi nomor satu yang paling digemari diantara bidang studi yang lain. Selama berkuliah di ITS penulis selalu aktif dalam bidang olahraga terutama Basket dan Flag Football. Banyak prestasi dalam bidang olahraga yang sudah dicapai mulai dari antar jurusan hingga tingkat nasional. Selain itu penulis juga aktif dalam berbagai kegiatan organisasi.

*One play at a time* adalah motto yang penulis percayai, yang artinya adalah kita harus fokus dengan satu urusan agar tidak ada hal yang terbengkalai. Terlepas dari lamanya masa kuliah yang dijalani, penulis tidak pernah khawatir tentang hal ini, karena tiap manusia memiliki *time zone* sendiri-sendiri dan rejeki tidak mungkin salah diberi. Penulis juga percaya bahwa manusia harus terus bermimpi, agar dapat menjalani hidup dengan *happy*.
