#### Abstract

This Crown Factory project is located in a good soil. Therefore, it will be easier to design with precast prestressed slabs on grade. The design includes the thickness of slabs and the needed prestressed post-tensioned tendon and reinforcement. The precast panel will be evaluated partly; it means each panel won't influence another panel. So, every panel will be connected with contraction joint and silien as a glue connector. Because of that, this slab is considered as secondary structure. Hence, it's a needed to design structural foundation as part of resisting external forces such as earthquake, wind, and rain. The structural foundation includes reinforcement pile cap and pile.

Not only the design, this final thesis project also identifies the appropriate precast erection method, especially for slab, and calculating the loss of prestressed that occurs from the erection.

Furthermore, this thesis will be analyzed the foundation of machine that considered as dynamic foundation. The design will includes calculating of pile cap and pile.

Keywords: Soil investigation, slabs on grade, SAFE software, prestressed, post-tensioned, reinforcement, erection method, dynamic foundation, pile.

## FOREWORD

First of all the writer would like to thank God, Jesus Christ-the most inspiration, that the writer can finish this final project report of "Redesign Foundation of Crown Project with Precast Prestressed Slab on Ground and Machine Foundation". The writer herself cannot finish this report without any support and assistance from others. I would like to say thank for everyone, especially for:

1. Both of my parents, mom and dad, and my brother, Daniel, who will be a pilot soon, and my twin as well, Natasha, who always take an adventure with me. Thanks for the support, your pray, and love
2. Prof. Tavio as my first advisor who gave big support and encouraged me to write this final project in English although I made many mistakes.
3. Mr. Ananta as my second advisor who gave many contributions, experiences, and knowledge.
4. Prof Raka as my guidance from the first I studied in this university who always give me the wise advices.
5. PT. TeamworX Indonesia, company that I had internship before, who gave me data and knowledge, especially Mr. Marangkup Manik, Mr. Eko, and others.
6. All of my lovely best friends in this university, "Perkebunan" and "Basecamp 57" who always help me and be there in my sad and happy, especially Teja and Emil.
7. All of my best friends from kindergarten till now who couldn't I say one by one. Thanks for every moment.
8. All other people that the writer cannot mention here one by one that helped him finishing this project.

The writer realizes that this report still needs to be improved. However, the writer hopes that this report will be useful for whom it may concern.

## CHAPTER 1 INTRODUCTION

### 1.1 Background

Based on the book of an old theory of architect, there are three primary criteria of a good building (Virtruvius, 2006) durability,convenience, andaesthetics. The three of them have an equal weight, none is more important than the others. In other words, a good structure meets the demands of durability that depend on the strength or stability, convenience means functionality or usefulness, and esthetic. But, that cost will determine the continuityof the construction. Will it stops or continues?Therefore, this thesis will explain one of the recenttechnologiesin civil engineering that willhelp to solve issues in construction world. PrecastPrestressed Slab on Gradefor example.Prestressedconcrete is too expensive for most people, because of the high quality material, such as high strength steel and high strength concrete, whereas, many advantages of prestressedcan cover the high cost of prestressed concrete.

Prestressed concrete is no longer a strange type of design. It is rather an extension and modification ofreinforcement concrete with high strength steel and concrete (Lin and Burns, 1981).By prestressing and anchoring the steel against the concrete, we produce desirable stresses and strains in both materials.As a result, it has the ability to resist the more load or crack. Beside of the material, curing is also an important thing to make a durable concrete. Curing in precast is much easier and better control then cast in situ.

High costs of prestressed concrete is probably the most common viewpoint among engineers, whereas, the cost will be reduced with some points. First, reducingthe thickness of floor or slab can reduce theoverall building height (especially for high rise building, to avoid the strong of wind load). Second, using precast construction can reduce the total weight of the structure resultingpile can be reduced too.Third, reducing the formwork
cost (as long as we use the same dimension of precast). Fourth, lower construction costs. Construct with precast save much time than concrete in-situ. Last, it considerable lower costs of maintenance because of the longer service life.

### 1.2 Statements of Problem

1. How to design one-way-slab with prestress?
2. How to erect the precast from fabricated area to project area?
3. How to control prestressed concrete strength with occurred load?
4. How to design machine foundation? )Both pile cap and pile)

### 1.3 Objectives

1. To design the dimension of precast
2. To analyze the post tensioned prestressed
3. To analyze the loss of prestressed
4. To design the appropriate foundation of machine
5. To design the appropriate foundation of each column

### 1.4 Scopes of Work

1. Soil bearing capacity will be calculated based on soil investigation report that had been investigated by Suryacipta Industrial Estate.
2. The upper structural calculating had been done by the vendor, PT. Bluescope Buildings.
3. The frequency of machine is supposed not disturbing, so there is no calculating of machine amplitude.
4. The previous designs of steel columns are supposed being able to resist earthquake moment. There is no analysis of steel strength.
5. Precast panel are analyzed as partly panel, so there are no joints calculating.
6. There is no comparative study between the previous and recently designin economic aspect.

## CHAPTER 2 LITERATURE REVIEW

### 2.1 Soil Investigation

### 2.1.1 N-SPT

With N correction:

1. Toward Groundwater ( N ') according to Terzaghi\& Peck
$\mathrm{N}^{\prime}=15+0.5(\mathrm{~N}-15)$, for $\mathrm{N}>15$
$\mathrm{N}^{\prime}=1.25$ for gravel or sandy gravel
2. Toward Soil Overburden Pressure $\left(\mathrm{N}_{2}\right)$ :

$$
\begin{align*}
& \mathrm{N}_{2}=\frac{4 . \mathrm{N}_{1}}{1+\left(0.4 \cdot \rho_{0}\right)} \text { if } \rho_{0} \leq 7.5 \mathrm{ton} / \mathrm{m}^{2}  \tag{1-2}\\
& \mathrm{~N}_{2}=\frac{4 . \mathrm{N}_{1}}{3.25+\left(1.4 \times \rho_{0}\right)} \text { if } \rho_{0} \geq 7.5 \mathrm{ton} / \mathrm{m}^{2} \tag{1-3}
\end{align*}
$$

$\rho_{0}=$ vertical soil pressure at a depth which is reviewed. $\mathrm{N}_{2}$ value is should be $\leq 2 \mathrm{~N}_{1}$, if the correction is obtained that $\mathrm{N}_{2}>2 \mathrm{~N}_{1}$, use $\mathrm{N}_{2}=\mathrm{N}_{1}(\rho \mathrm{o}=\gamma \mathrm{t}$ x h)

### 2.1.2 Pile Foundation

Piles are structural members that are made of steel, concrete, or timber. They are used to build pile foundations, which are deep and which cost more than shallow foundations. Despite the cost, the use of piles often is necessary to ensure structural safety (Das, Seventh Edition, 2007).

### 2.1.2.1 Estimating Pile Length

Piles can be divided into three major categories, depending on their lengths and mechanism of load transfer to the soil:

1. Point bearing piles
2. Friction piles
3. Compaction piles

## 1. Point bearing piles

If soil-boring records establish the presence of bedrock or rocklike material at a site within the reasonable depth, pile can be extended to the rock surface. In this case, the ultimate capacity of the piles depends on the load bearing capacity of the under-lying material. This piles are called point bearing capacity.

Piles with pedestals can be constructed on the bed of the hard stratum, and the ultimate pile load may be expressed as

$$
\begin{equation*}
Q_{u}=Q_{p}+Q_{s} \tag{1-4}
\end{equation*}
$$

where:
$\mathrm{Q}_{\mathrm{p}}=$ load carried at the pile point
$=\mathrm{qp} \mathrm{x} \mathrm{Ap}$
$=\alpha \times \mathrm{Np} \times \mathrm{K} \times \mathrm{Ap}$
$q p=$ point stress pile
$\mathrm{Ap}=$ section area pile
$\mathrm{Np}=\mathrm{SPT}$ average for 4B upper till 4B bellow pile ( B is pile diameter)
$\mathrm{K}=$ Soil characteristic coefficient
$\mathrm{Q}_{\mathrm{s}}=$ load carried by skin friction developed at the side of the pile (caused by shearing resistance between the soil and the pile)
$=\mathrm{qs} \mathrm{x}$ As
$=\beta \times\left(\frac{\mathrm{Ns}}{3}+1\right) \times \mathrm{As}$
$\beta=$ Shaft coefficient intermediate soils for driven pile $=1$
$\mathrm{Ns}=$ SPT average for planted pile, boundary $3 \leq \mathrm{N} \leq 50$
$\mathrm{As}=$ Luasselimuttiangtertanam
$\mathrm{qs}=$ Teganganakibatgesertiang

Figure 2.1 Forces that work on poimt bearing piles

## 2. Friction piles

When no layer of rocklike material is present at a reasonable depth at a site, point bearing piles become very long and uneconomical. These piles are called friction piles, because the most of their resistance is derived from skin friction.

$$
Q_{u}=Q_{s}
$$

The length of friction piles depend on the shear strength of the soil, the applied load, and the pile size.
3. Compaction Piles

Under certain circumstances, piles are driven in granular soils to achieve proper compaction of soil close to the ground surface. These piles are called compaction piles. The compaction length depends on factors such as; the relative density of the soil before compaction, the desired relative density of the soil after compaction, and the requires depth of compaction.

### 2.1.2.3 Maximum Load of Every Pile

To calculate or check how many pile will be needed, analyzing the strength of each pile is a must. As the formula bellow

$$
\begin{equation*}
P_{\max }=\frac{\mathrm{V}}{\mathrm{n}}+\frac{\mathrm{M}_{\mathrm{x}} \times \mathrm{Y}_{\max }}{\sum \mathrm{Y}_{2}}+\frac{\mathrm{M}_{\mathrm{y}} \times \mathrm{X}_{\max }}{\sum \mathrm{x}_{2}} \tag{1-7}
\end{equation*}
$$

Where:

| $\mathrm{P}_{\text {max }}$ | = Maximum load for one pile |
| :---: | :---: |
| $\Sigma \mathrm{P}$ | $=$ Total axial load occurred |
| Mx | = Moment in X direction |
| My | = Moment in Y direction |
| Xmax | = Absistiangpancangterjauhterhadapgaris beratkelilingtiang |
| Ymax | = Ordinattiangpancangterjauhterhadapgaris beratkelilingtiang |
| $\sum \mathrm{X}^{2}$ | = Jumlahkuadratabsistiangpancangterhadap garisberatkelompoktiang |
| $\sum \mathrm{Y}^{2}$ | = Jumlahkuadratordinattiangpancangterhadap garisberatkelompoktiang |
| n | $=$ total of pile $=48$ |

### 2.1.2.3 Group Efficiency

In most cases, piles are used in groups to transmit the structural load to the soil. A pile cap is constructed over group piles. The cap can be contacted with the ground or well above the ground.

The efficiency of the load-bearing capacity of the group pile may be defined as

$$
\begin{equation*}
\eta=\sqrt{\frac{\mathrm{Qb}^{2}}{\mathrm{Qb}^{2}+\mathrm{nQ} 1^{2}}} \tag{1-8}
\end{equation*}
$$

### 2.2 Precast Slab Concrete

All slab dimension are based on SNI 7833:2012, Tata Cara
PerancanganBetonPracetakdanBetonPrateganguntukBangunanGe dung.

### 2.2.1 Slab Thickness

Slam thickness will be considered base on their type and dimension. PTI has had the standard of thickness

Table 2.1 Maximum Span-to-Depth Ratios for Post-Tensioned Flat Slabs (Post Tensioning Institute)

| One-way slab | 48 |
| :--- | :--- |
| Two-way slab | 45 |
| Two-way slab with drop panel | 50 |
| Two way-slab with two-way beams | 55 |
| Waffle (5 x 5 grid) | 35 |
| Beams b=h/3 | 20 |
| Beams b=3h | 30 |

### 2.2.2 Decking Concrete (d)

According to SNI 7843:2012 chap. 4.6.2.3.3, tolerance of concrete decking is based on the thickness of slab

Table 2.2 Tolerance of d

| Slab thickness | Tolerance of d |
| :---: | :---: |
| $\mathrm{d} \leq 200 \mathrm{~mm}$ | $\pm 10 \mathrm{~mm}$ |
| $\mathrm{~d} \geq 200 \mathrm{~mm}$ | $\pm 13 \mathrm{~mm}$ |

### 2.3 Prestressing

Because of high creep and shrinkage losses in concrete, effective prestressing can be achieved by using very high strength steels in the range of $1,862 \mathrm{MPa}$ or higher. Such high strength steels are able to counterbalance these losses in the surrounding
concrete and have adequate leftover stress levels to sustain the required prestressing force.

Prestressing reinforcement can be in the form of single wires, strands composed of several wires twisted to form a single element, and high strength bars.

### 2.3.1 ACI Maximum Permissible Stresses in Concrete and Reinforcement

Following are definitions of some important mathematical term used in calculating.
$f_{p y} \quad=$ specified yield strength of prestressing tendons (MPa)
$f_{y} \quad=$ specified yield strength of non-prestressed reinforcement(MPa)
$f_{p u} \quad=$ specified tensile strength of prestressing tendons (MPa)
$f^{\prime}{ }_{c} \quad=$ specified compressive strength of concrete (MPa)
$f_{c i}^{\prime} \quad=$ compressive strength of concrete at time of initial prestress

### 2.3.1.1 Concrete Stresses in Flexure

Stresses in concrete immediately after prestress transfer (before time dependent prestress losses) shall not exceed the following:
a) Extreme fiber stress in comparison $0.60 f^{\prime}{ }_{c i}$
b) Extreme fiber stress in tension except as permitted in (c) $3 \sqrt{f^{\prime} c i}$
c) Extreme fiber stress in tension at ends of simply

Where computed tensile stresses exceed these values, bonded auxiliary reinforcement (non-prestresses or prestressed) shaal be provided in the tensile zone to resist the total tensile force in concrete computed under the assumption of an uncracked section.

Stresses in concrete at service loads (after allowance for all prestress losses) shall not exceed the following:
a) Extreme fiber stress in compression due to prestress plus sustained load, where sustained dead load and
live load are a large part of the total service load $0.45 f^{\prime}{ }_{c}$
b) Extreme fiber stress in compression due to prestress plus total load, id the live load is transient $0.60 f^{\prime}{ }_{c i}$
c) Extreme fiber stress in tension in precompressed tensile zone $6 \sqrt{f^{\prime} c}$
d) Extreme fiber stress in tension inprecompressed tensile zone of member (except way slab systems), where analysis based on transformed cracked section and on bilinear moment-deflection relationship shows that immediate and long-time deflection comply with the ACI definition requirements and mimimum concrete cover requirements $12 \sqrt{f^{\prime} c}$

### 2.3.1.2 Prestressing Steel Stresses

Tensile stress in prestressing tendons shall not exceed the following:
a) Due to jacking force $0.94 f_{p y}$, but not greater than the lesser of $0.80 f_{p u}$ and the maximum value recomendedby the manufacturer of prestressing tendons or anchorages.
b) Immidiately after prestress transfer $0.82 f_{p y}$, but not greater than of $0.74 f_{p u}$
c) Post-tensioning tendons, at anchorages and couplers, immediately after tendon anchorage $0.70 f_{p u}$

### 2.3.2 Prestressing System and Anchorage

### 2.3.2.1 Pretensioning

Prestressing steel is pretensioned against independent anchorages prior to the placement of concrete around it. Such anchorages are supported by large and stable bullheads to support the exceedingly high concentrated forces applied to the individual tendons. Prestressing can be accomplished by prestressing individual strands, or all the strands at one jacking operation.

### 2.3.2.2 Post Tensioning

In post-tensioning, the strands, wires, or bars are tensioned after hardening of the concrete. The strands are placed in the longitudinal ducts within the precast concrete element. The prestressing force is transferred through end anchorages. The tendons of strands should not be bonded or grouted prior to full prestressing.

### 2.3.2.3 Jacking System

One of fundamental components of a prestressing operation is the jacking system applied, i.e., the manner in which the prestressing force is transferred to the steel tendons.

### 2.3.3 Loss of Prestress

It is a well established fact that the initial prestressing force applied to the concrete element undergoes a progressive process over a period of approximately five years. Consequently, it is important to determine the level of prestressing force at each loading stage, from the stage of transfer of the prestressing force to the concrete to the various stages of prestressing available at the service load, up to the ultimate. Essentially, the reduction in the prestressing force can be grouped into two categories:

- Immediate elastic loss during the fabrication or construction process, including elastic shorthening, anchorage loasses, and frictional losses.
- Time dependent losses such as creep, shrinkage, and those due to temperature effects and steel relaxation, all of which are determinable at the service load limit stage of stress in the prestressed concrete element.

A summary of the sources of the separate prestressing losses and the stagesof their occurance is given in Table 2.3. From this table, the total loss in prestress can be calculated for pretemsioned and post-tensioned members as follows:

Table2.3 Types of Prestress Loss

| Type of prestress loss | Stage of occurrence |  | Tendon stress loss |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Pretensioned members | Post-tensioned members | During time interval ( $t_{p}, t_{\rho}$ ) | Total or during life |
| Elastic shortening of concrete (ES) | At transfer | At sequential jacking | $\cdots$ | $\Delta f_{p E S}$ |
| Relaxation of tendons (R) | Before and after transfer | After transfer | $\Delta f_{p R}\left(t_{i}, t_{j}\right)$ | $\Delta f_{p R}$ |

### 2.3.2.1 Elastic Shortening of Concrete

Concrete shortens when a prestressing force is applied. As the tendons that are bonded to the adjacent concrete simultaneously shorten, they lose part of the prestresseing force that they carry.

## a. Pretensioned Element

For pretensioned (precast) elements, the compressive force imposed on the beam by the tendon results in the longitudinal shorteningof the beam.

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pES}}=\mathrm{E}_{\mathrm{s}} \in_{\mathrm{ES}}=\frac{\mathrm{E}_{\mathrm{s}} \mathrm{P}_{\mathrm{i}}}{\mathrm{~A}_{\mathrm{c}} \mathrm{E}_{\mathrm{c}}}=\frac{\mathrm{nP}_{\mathrm{i}}}{\mathrm{~A}_{\mathrm{c}}}=\mathrm{nf}_{\mathrm{cS}} \tag{2-1}
\end{equation*}
$$

b. Post-tensioned Element

In the post-tensioned beams, the elastic shortening loss varies from zero if all tendons are jacked simultaneously to half the value calculated in the pretensioned case if several sequential jacking steps are used, such as jacking two tendons at a time. If $n$ is the number of tendons or pairs of tendons sequentially tensioned, then

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pES}}=\frac{1}{\mathrm{n}} \sum_{j=1}^{n}\left(\Delta \mathrm{f}_{\mathrm{pES}}\right) \mathrm{j} \tag{2-2}
\end{equation*}
$$

where j denotes the number of jacking operations. Note that the tendon that was tensioned last does not suffer any losses
due to elastic shortening, while the tendon that was tensioned first suffers the maximum amount of loss.

### 2.3.2.2 Steel Stress Relaxation (R)

Stress relieved tendons suffer loss in the prestressing force due to constant elongation with time. The magnitude of the decrease in the prestress depends not only the duration of the sustained prestressing force, but also on the ratio $f_{p i} / f_{p y}$ of the initial prestress to the yield strength if the reinforcement. Such a loss in stress is termed stress relaxation.

The ACI 318-05 Code limits the tensile stressin the prestressing tendons to the following:
a) For stresses due to the tendon jacking force, $\mathrm{f}_{\mathrm{pJ}}=0.94 f_{p y}$, but not greater than the lesserof $0.80 f_{p u}$ and the maximum value recommended by the manufacturer of the tendons and anchorages.
b) Immediately after prestress transfer, $\mathrm{f}_{\mathrm{pi}}=0.82 f_{p y}$ but not greater than $0.74 f_{p u}$
c) In the post-tensioned tendons, at the anchorages and couplers immediately after the force transfer $=0.74 f_{p u}$
The range of values of $f_{p y}$ is given by the following:

- Prestressing bars: $f_{p y}=0.8 f_{p u}$
- Stress relieved tendons: $f_{p y}=0.85 f_{p u}$
- Low relaxation tendons: $f_{p y}=0.9 f_{p u}$

The ACi method use the separate contributions of elastic shortening, creep, and shrinkage in the evaluation of the steel stress relaxation loss by means of the equation

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pR}}=\mathrm{K}_{\mathrm{re}}-\mathrm{J} \Delta\left(\mathrm{f}_{\mathrm{pES}}+\mathrm{f}_{\mathrm{pCR}}+\mathrm{f}_{\mathrm{pSH}} \times \mathrm{C}\right. \tag{2-3}
\end{equation*}
$$

The values of $\mathrm{K}_{\mathrm{re}}$, J , and C are given in Table 2.4

Table 2.4 Values of C

|  | Stress-relieved <br> strand or wire | Stress-relieved bar <br> or Iow-relaxation <br> strand or wire |

### 2.3.2.2 Creep Loss (CR)

Experimental work over the past half century indicates that flow in materials occurs with time when load or stress exists. This lateral flow or deformation due to the longitudinal stress is termed creep.

The ACI-ASCE Committee expression for evaluating creep loss has essentially the same format as bellow:

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pCR}}=\mathrm{nK}_{\mathrm{CR}}\left(\mathrm{f}_{\mathrm{cs}}-\mathrm{f}_{\mathrm{csd}}\right) \tag{2-4}
\end{equation*}
$$

where:
$\mathrm{K}_{\mathrm{CR}} \quad=2.0$ for pretensioned members
$=1.6$ for post-tensioned members
$\mathrm{f}_{\mathrm{cs}} \quad=$ stress in concrete at level of steel cgs immediately after transfer
$\mathrm{f}_{\mathrm{csd}} \quad=$ stress in concrete at level of steel cgs due to all superimposed dead loads applied after prestressing is accomplished
$\mathrm{n} \quad=$ modular ratio $=\frac{\mathrm{E}_{\mathrm{ps}}}{\mathrm{E}_{\mathrm{c}}}$

### 2.3.2.2 Shrinkage Loss (SH)

As with concrete creep, the magnitude of the shrinkage of concrete is affected by several factors. Size and shape of the member also effect shrinkage. Approximately $80 \%$ of shrinkage takes place in the first year of life of the structure.

For post-tensioned members, the loss in prestressing due to shrinkage is somewhat less since some shrinkage has already taken place before post-tensioning. If the relative humidity is taken as a percent value and the V/S ratio effect is considered, the PCI general expression for loss in prestressing due to shrinkage becomes

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pSH}}=8.2 \times 10^{-6} \mathrm{~K}_{\mathrm{SH}} \mathrm{E}_{\mathrm{ps}}\left(1-0.006 \frac{\mathrm{v}}{\mathrm{~s}}\right)(100-\mathrm{RH}) \tag{2-5}
\end{equation*}
$$

where the $\mathrm{K}_{\mathrm{SH}}$ is shown in Table 2.5
Table2.5 Values of Ksh for Post-Tensioned Members

| Time from end <br> of moist curing <br> to application <br> of prestress, days | $\mathbf{1}$ | $\mathbf{3}$ | $\mathbf{5}$ | $\mathbf{7}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ | $\mathbf{3 0}$ | $\mathbf{6 0}$ |

Source: Prestressed Concrete Institute.

### 2.3.2.2 Loss due to Friction (F)

Loss of prestressing occurs in post-tensioning members due to friction between the tendons and the surrounding concrete ducts. it is influenced by:
a) Curvature effect $=$ Tendon form or alignment
b) Wooble effect $=$ The local deviations in the alignment

Assuming that the prestress force between the start of the curved portion and its end is small, it is sufficient accurate to use the initial tension for the entire curve, and can be simplified to yield:

$$
\begin{equation*}
\Delta f_{p f}=-f_{1}(\mu \alpha+K L) \tag{2-6}
\end{equation*}
$$

Table 2.6 Wooble and Curvature Friction Coefficients

| Type of tendon | Wobble coefficient, <br> $\boldsymbol{K}$ per foot | Curvature <br> coefficient, $\boldsymbol{\mu}$ |
| :--- | :--- | :---: |
| Tendons in flexible metal sheathing | $0.0010-0.0015$ |  |

| Pregreased tendons <br> Wire tendons and 7-wire strand |  |  |

Source: Prestressed Concrete Institute.

### 2.3.2.2 Anchorage Seating Losses (A)

Anchorage seating losses occur in post-tensiones members due to the seating of wedges in the anchors when the jacking force is transferred to the anchorage.

$$
\begin{equation*}
\Delta \mathrm{f}_{\mathrm{pA}}=\frac{\Delta_{\mathrm{A}}}{\mathrm{~L}} \mathrm{E}_{\mathrm{ps}} \tag{2-7}
\end{equation*}
$$

### 2.4 Mild Steel Reinforcement

Mild-steel reinforcement will be design to resist moment. The top reinforcement will resist negative moment from erection, and the bottom reinforcement will resist positive moment from service load.

There are some variables will be needed to calculate mild steel reinforcement:
(based SNI 2847:2013 chap. 10.2.7.3)
$\beta_{1}$

$$
\begin{equation*}
=0.85-0.05\left(\frac{\mathrm{fc}-28}{7}\right) \tag{2-8}
\end{equation*}
$$

(based on Appendix B.8.4.2 SNI 2847:2013)

$$
\begin{equation*}
\rho_{\mathrm{b}} \quad=\frac{0,85 \times \beta_{1} \times f_{c}^{\prime}}{400} \times\left(\frac{600}{600+f_{y}}\right) \tag{2-9}
\end{equation*}
$$

(based on Appendix B.10.3.3 SNI 2847:2013)
$\rho_{\text {max }} \quad=0.75 \rho_{\mathrm{b}}$
(based on SNI 2847:2013 chap. 10.5.1)
$\rho_{\min 1} \quad=\frac{0,25 \times \sqrt{f_{c}{ }^{\prime}}}{f_{y}}$
$\rho_{\text {min2 }} \quad=\frac{1.4}{\text { fy }}$
(based on SNI 2847:2013 chap. 7.12.2.1)
$\rho_{\text {shrinkage }} \quad=0.002$
(based on SNI 2857:2013 chap. 7.12.2.1)
reduction factor for flexural reinforcement, $\phi=0.9$

## CHAPTER 4 SLAB ON GROUND DESIGN

### 4.1 Preliminary Design

Crown project has a building that is used to be office, storage room, and production place. Because of the wide area (almost $3,500 \mathrm{~m}^{2}$ ), it will be faster to design the foundation with precast slab-on-ground. Figure 4.1 shows the side plan of precast that will be constructed.

Figure 4.1 Side Plan of Precast

Warehouse and office rooms are planned to be precast as working floor, they just receive live load, while the earthquake load will be
constructed with dead load and received by
column towards by deep foundation (pile cap and pile), while, for canmaker machine foundation, it will be designed by dynamic foundation.

### 4.1.1 Slab Thickness

Figure 4.2 Precast slab design
Slab thickness will be considered based on their type and dimension. PTI has had the standard of thickness as shown in Table 4.1.

Table 4.1Maximum Span-to-Depth Ratios for Post-Tensioned Flat Slabs (Post Tensioning Institute)

|  | One-way slab |
| :--- | :---: |
| Two-way slab | 48 |
| Two-way slab with drop panel | 50 |
| Two way-slab with two-way beams | 55 |
| Waffle (5 x 5 grid) | 35 |
| Beams b=h/3 | 20 |
| Beams b=3h | 30 |

Slab thickness, $\mathrm{h}=\frac{600 \mathrm{~cm}}{48}=12.5 \mathrm{~cm} \approx 25 \mathrm{~cm}$
Thickness of slab will design 25 cm considered to the room for tendon and mild-steel reinforcement

Figure 4.3 Precast slab thicknesses

### 4.1.2 Design Planning of Slab

$$
\begin{array}{ll}
\mathrm{A} & =\mathrm{b} \times \mathrm{h}=3 \times 0.25=1.5 \mathrm{~m}^{2}=750,000 \mathrm{~mm}^{2} \\
\mathrm{I} & =\frac{1}{4} \mathrm{bh}^{3} \\
& =\frac{1}{4} \times 3,000 \times 250^{3} \\
& =1.172 \times 10^{10} \mathrm{~mm}^{2} \\
\mathrm{Yt} & =\text { top boundary }=125 \mathrm{~mm} \\
\mathrm{Yb} & =\text { bottom boundary }=125 \mathrm{~mm} \\
\mathrm{E} & =200,000 \mathrm{MPa} \\
\mathrm{~W}_{\mathrm{t}} & =\frac{\mathrm{I}}{\mathrm{y}_{\mathrm{t}}}=\frac{1.172 \times 10^{10}}{125}=93.75 \times 10^{6} \\
\mathrm{~W}_{\mathrm{b}} & =\frac{\mathrm{I}}{\mathrm{y}_{\mathrm{b}}}=\frac{1.172 \times 10^{10}}{125}=93.75 \times 10^{6} \\
\mathrm{~d} & =\text { concrete cover }=25 \mathrm{~mm}
\end{array}
$$

There is no eccentricity ( $\mathrm{e}=0$ ) in this case, to prevent slab deflection right after installation and before service load.

Figure 4.4 Eccentricity of prestress

### 4.1.3 Prestress Product:

## fReyssinet

SUSTAInABLE TECHNOLOGY

Freyssinetprestress will be used with characteristics and specifications bellow:

- F range anchor, intended for the prestressing of thin elements (slab, concrete floor, etc.)
- Bonded internal prestressing
- Multi strand units $5 \mathrm{~F} / 13$

Figure 4.5Anchorage of Prestress

|  |  | 12.9 | 100 | 0.78 | 186 | 16.4 |
|  |  | 15.3 | 140 | 1.09 | 260 | 229 |
|  |  | 15.7 | 150 | 1.16 | 279 | 246 |

- Nominal Diameter of Strand $=15.7 \mathrm{~mm}$
- Nominal Steel Area of Strand $=150 \mathrm{~mm}^{2}$
- Breaking Strength, $f_{p u}$
$=1770 \mathrm{MPa}$
- Yielding Strength, $f_{p y} \quad=0.7 \mathrm{x} f_{p u}=1239 \mathrm{MPa}$
- Elasticity Modulus
$=200,000 \mathrm{MPa}$

### 4.2 Erection Precast

When the slab is erected, it is supposed as simple beam. It will be lifted up by 4 points. These points are planted in the precast in distance of 0.207 L from the edge of slab.

$$
\begin{array}{lll}
\mathrm{fc}^{\prime} & =50 \mathrm{MPa} & =500 \mathrm{~kg} / \mathrm{m}^{2} \\
\mathrm{fy} & =410 \mathrm{MPa} & =4000 \mathrm{~kg} / \mathrm{m}^{2} \\
\mathrm{~b}=6 \mathrm{~m} ; \mathrm{a} & =3 \mathrm{~m} &
\end{array}
$$

Figure 4.6 Erection Point Pick-up of Precast

### 4.3 Load and Load Combinations

Precast accommodates dead load and live load occur on
the slab on ground.
Dead Load (DL) = slab weight that adjusted to the slab thickness, occurred in jacking and erection
$=2400 \mathrm{~kg} / \mathrm{m}^{3} \times 0.25 \mathrm{~m} \mathrm{x} \mathrm{3m}$
$=1800 \mathrm{~kg} / \mathrm{m}$

Jacking condition ( $X$ direction):

Erection Condition (X direction):

Erection Condition (Y direction):

Figure 4.6 Dead Load

Live Load (LL) = vehicle, human, and another load that were approximated by consultant

$$
\begin{aligned}
& =25 \mathrm{kN} / \mathrm{m}^{2} \times 3 \mathrm{~m} \\
& =75 \mathrm{kN} / \mathrm{m}^{2}=7500 \mathrm{~kg} / \mathrm{m}
\end{aligned}
$$

Sevice condition ( $X$ direction):

Service condition (Y direction):

Figure 4.7 Live Load

f. $\quad 0.9 \mathrm{D}+1.0 \mathrm{~W}$
g. $\quad 0.9 \mathrm{D}+1.0 \mathrm{E}$

### 4.4 Element Forces

There are two longitudinal section those will be observed, XZ direction and YZ direction. Element forces in XZ direction will be resisted by tendon and element forces in YZ direction will
be resisted by mild steel reinforcement. There are three kinds of condition those will be observed:

1. Precast in fabric before erection (influenced by dead load of self weight) - Condition A
2. Precast when erected (dead load with erected point) Condition B
3. Precast at service load (dead load and live load) - Condition C

### 4.4.1 $\quad X$ direction

This sub-chapter shows any kinds of element forces (shear and moment) that occurred in slab both in X direction at jacking, erection and service condition.

Figure 4.8 Shear Forces in Condition A (X Direction)

Figure 4.9 Moment Forces in Condition A (X Direction)

Figure 4.10 Shear Forces in Condition B (X Direction)

Figure 4.11Moment Forces in Condition B (X Direction)

Figure 4.12 Shear Forces in Condition C (X Direction)

Figure 4.13Moment Forces in Condition C (X Direction)

### 4.4.2 $Y$ direction

This sub-chapter shows any kinds of element forces (shear and moment) that occurred in slab both in X direction at jacking, erection and service condition.

### 4.5 Permissible Stress andInitial Force (Fo)

### 4.5.1 Maximum Permissible Stresses in Concrete and Reinforcement

According to SNI 7833:2012 chap. 6.4, there are some permissible stresses in concrete and reinforcement. In this book, compression stress will be considered as minus, while tension stress will be considered as plus.

1. Transfer/jacking/erection condition:

$$
\begin{array}{ll}
\text { Compression }\left(\sigma_{\mathrm{cl}}\right) & =-0.6 \mathrm{fc}^{\prime} \\
& =-0.6 \times 50 \\
& =-30 \mathrm{MPa} \\
\text { Tension }\left(\sigma_{\mathrm{t} 1}\right) & =0.5 \times \sqrt{\mathrm{fc}^{\prime}} \\
& =0.5 \times \sqrt{50} \\
& =3.536 \mathrm{MPa}
\end{array}
$$

2.Service:

| Compression $\left(\sigma_{\mathrm{c} 2}\right)$ | $=-0.45 \mathrm{fc}$ |
| ---: | :--- |
|  | $=-0.45 \times 50$ |
|  | $=-22.5 \mathrm{MPa}$ |
| Tension $\left(\sigma_{\mathrm{t} 2}\right)$ | $=0.25 \sqrt{\mathrm{fci}}$ |
|  | $=0.25 \sqrt{50}$ |
|  | $=1.768 \mathrm{MPa}$ |

### 4.5.2 Initial Forces (Fo)

Initital force before loss prestress can be approximated (Lin and Burn). The using moment is from the critical moment with envelope combination.

$$
\mathrm{Fo}=\frac{\mathrm{M}}{0.65 \mathrm{~h}}=\frac{599.4 \mathrm{kNm}}{0.65 \times 0.25}=3,688.62 \mathrm{kN}
$$

### 4.6 Loss of Prestress

The stresses of the distinctive feature of structural system may be tailored to the desired level to assure satisfactory performance. Hence, it is noted that the prestress force used in making the stress computation will not remain constant time. The actual materials and individual circumstances (time elapsed, exposure conditions, dimension, and size of member) must be considered as the time goes by which influence the amount of loss prestresss(Lin, T.H, Third Edition).

There are two kinds of prestress losses as mentioned bellow:

- Short term or stressing losses - These are losses that occurs during and immediately after the post-tensioning operations and are caused by:

1. Loss due to friction between the tendons and the ducts
2. Elastic shortening
3. Seating of anchors
4. Loss due to steel relaxation

- Long term losses - These types of losses happen over time and also may be referred to as time dependant losses:

1. Loss due to creep of concrete
2. Loss due to shrinkage of concrete

### 4.6.1 Friction Loss

It is known that there is some friction in the jacking and anchorage system, so that the stress existing in the tendon is less than indicated by the pressure gage.

$$
\Delta \mathrm{f}_{\mathrm{pf}}=\mathrm{e}^{(-\mu \alpha-\mathrm{KL})}
$$

where:

$$
\alpha=\frac{8 \mathrm{y}}{\mathrm{x}}=\frac{8 \times 40}{6000}=0.05333
$$

andwooble coefficient (K) and curvature coefficient $(\mu)$ are determined by Freyssinet:

$$
\begin{array}{ll}
\mathrm{K} & =0.007 \\
\mu & =0.05 \\
\mathrm{~L} & =6 \mathrm{~m}
\end{array}
$$

Table 4.6 Friction loss tendon

| Segment | L | KL | $\alpha$ | $\mu \alpha$ | KL+ $\alpha^{\text {a }}$ | -KL- $\mu \boldsymbol{\alpha}$ | $\mathrm{e}^{\wedge}(-K L-\mu \alpha)$ | \% |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AB | 6 | 0.042 | 0.0667 | 0.00333 | 0.04533 | -0.045333 | 0.9557 | 4.4321 |

### 4.6.2 Elastic Shortening of Concrete (ES)

As the prestress is transferred to the concrete, the member shortens and the prestressedsteel shortens with it. Hence, there is a loss of prestress in the steel.

Loss of prestress in steel is:

$$
\mathrm{ES}=\Delta \mathrm{fs}=\mathrm{E}_{\mathrm{s}} \delta=\frac{\mathrm{E}_{\mathrm{s}} \mathrm{~F}_{0}}{\mathrm{~A}_{\mathrm{c}} \mathrm{E}_{\mathrm{c}}}=\frac{n F_{0}}{A_{c}}
$$

Table 4.7 Precast prestress specification

| Precast Prestress Specification |  |  |
| :--- | ---: | :--- |
| Fo | 3688615 | N |
| d strand | 15 | mm |
| n strand | 25 |  |
| n tendon | 5 |  |
| A concrete | 750000 | mm 2 |
| A anchora | 28000 | mm 2 |
| E steel | 20000 | $\mathrm{~N} / \mathrm{mm} 2$ |
| E concrete | 33234.01872 | $\mathrm{~N} / \mathrm{mm} 2$ |

From the data of precast prestress specification, the loss of prestress due to elastic shortening can be calculated:

Table 4.8 Elastic shortening for each tendon

| Tendon | $\mathbf{n}$ | Fo (N) | $\mathbf{A c}$ <br> $(\mathbf{m m 2})$ | $\boldsymbol{\Delta} \mathbf{f s}$ <br> $\mathbf{( N / m m 2 )}$ | Kumulatif | Total (\%) |
| ---: | :---: | ---: | :---: | ---: | ---: | ---: |
| 1 | 6.01793 | $3,688,615$ | 750000 | 29.5971 | 118.3884 | 6.6886 |
| 2 | 6.01793 | $3,688,615$ | 750000 | 29.5971 | 88.7913 | 5.0165 |
| 3 | 6.01793 | $3,688,615$ | 750000 | 29.5971 | 59.1942 | 3.3443 |
| 4 | 6.01793 | $3,688,615$ | 750000 | 29.5971 | 29.5971 | 1.6722 |
| 5 | 6.01793 | $3,688,615$ | 750000 | 29.5971 | 0 | 0 |

### 4.6.3 Loss Due to Anchorage Take Up

Losses occur due to slip of wires during anchoring or due to strain anchorage is of important in case of post-tensioned system. For any anchoring system, slip is roughly constant. In case of Freyssinet cones, the slip is 6 mm for 5 mm wires and 9 mm for 7 mm wires.

Considering the release of strain due to slip $\Delta_{\mathrm{s}}$, as uniform throughout the length L of the wire, the loss of prestress $\Delta_{\mathrm{fs}}$, is given by:

$$
\Delta_{\mathrm{fs}}=\mathrm{E}_{\mathrm{s}}=\frac{\Delta_{\mathrm{s}}}{\mathrm{~L}}
$$

But Freyssinet has had determined the loss of slip anchorage is 3\%

### 4.6.4 Loss Due to Steel Relaxation

Test of prestressing steel with constant elongation maintained over a period of time have shown that the prestress force will decrease depends on both time duration and the ration (fpi/fpy). The loss of prestress is called relaxation.

The ACI-ASCE Committee uses the equation bellow to calculate the relaxation loss:

$$
\mathrm{RE}=\left(\mathrm{K}_{\mathrm{re}}-\mathrm{J}(\mathrm{SH}+\mathrm{CR}+\mathrm{ES})\right) \mathrm{C}
$$

But Freyssinet had determined the maximum elongation at 1,000 hours under 0.7 fpk for all strands is $\leq 2.5 \%$ ( 5 tendons), $0.5 \%$ for 1 tendon.

### 4.6.5 Loss due to Creep of Concrete

Creep is assumed to occur with the superimposed permanent dead load added to the member after it has been prestressed. Part of the initial compressive strain induced in the concrete immediately after transfer is reduced by the tensile strain resulting from the superimposed permanent dead load.

For unbonded tendons the average compressive stress is used to evaluate losses due to elastic shortening and creep of concrete losses. The losses in the unbounded tendon are related to the average member strain rather than strain at the point of maximum moment. Thus:

$$
\mathrm{CR}=\mathrm{K}_{\mathrm{cr}} \frac{\mathrm{E}_{\mathrm{s}}}{\mathrm{E}_{\mathrm{c}}} \mathrm{f}_{\mathrm{cpa}}
$$

$$
\begin{aligned}
& \begin{array}{l}
\mathrm{K}_{\mathrm{cr}}=1.6 \text { for post-tensioned members } \\
\mathrm{fcpa}=3.33 \mathrm{~N} / \mathrm{mm}^{2}
\end{array} \\
& \qquad \begin{array}{l}
\mathrm{CR}=1.6 \frac{200000}{33234} 3.33=32 \mathrm{~N} / \mathrm{mm}^{2} \text { (for } 5 \text { tendons) } \\
\quad \mathrm{CR}=6.5 \mathrm{~N} / \mathrm{mm}^{2}=0.36 \% \text { (for } 1 \text { tendon) }
\end{array} .
\end{aligned}
$$

### 4.6.6 Loss due to Shrinkage of Concrete

Shrinkage of concrete is influenced by many factors which are most important: volume-to-surface ratio (V/S), relative humidity (RH), and time from end of moist curing to application of prestress. The factors can be seen bellow, as they influenced the product of the effective shrinkage, $\mathrm{E}_{\mathrm{sh}}$ :

$$
E_{s h}=8.2 \times 10^{-6}\left(1-0.06 \frac{\mathrm{~V}}{\mathrm{~S}}\right)(100-R H)
$$

Shrinkage loss will be influenced by only other, it's the coefficient $\mathrm{K}_{\text {sh }}$ which reflects the fact that the post-tensioned members benefit from the shrinkage which occurs prior to the post-tensioning.

$$
\mathrm{SH}=8.2 \times 10^{-6} \mathrm{~K}_{\mathrm{sh}} \mathrm{E}_{\mathrm{S}}\left(1-0.06 \frac{\mathrm{~V}}{\mathrm{~S}}\right)(100-\mathrm{RH})
$$

Table 4.9 Values of $K_{\text {sh }}$ for post-tensioned members

| Time after end of moist curing to <br> application of prestress, days | 1 | 3 | 5 | 7 | 10 | 20 | 30 | 60 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Ksh | 0.92 | 0.85 | 0.8 | 0.77 | 0.73 | 0.64 | 0.58 | 0.45 |

$\mathrm{K}_{\text {sh }}=0.60$ (concrete 28 days)
$\mathrm{E}_{\mathrm{S}} \quad=200000 \mathrm{~N} / \mathrm{mm}^{2}$
$\mathrm{V}=4.5 \mathrm{~m}^{3}$
$\mathrm{S}=0.75 \mathrm{~m}^{2}$
$R H=70 \%$

So, it is calculated as bellow:

$$
\begin{aligned}
\mathrm{SH} & =8.2 \times 10^{-6} \times 0.6 \times 200000\left(1-0.06 \frac{4.5}{0.75}\right)(100-70) \\
\mathrm{SH} & =18.9 \% \text { (for } 5 \text { tendons) } \\
& =3.78 \% \text { (for } 1 \text { tendon) }
\end{aligned}
$$

Table 4.10 Total Loss for every tendon:

| Tendon | ES (\%) | CR (\%) | SH (\%) | RE (\%) | FS (\%) | FL (\%) | Total Loss (\%) |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | 6.6886 | 0.3623 | 3.78 | 0.5 | 3 | 4.3684 | 18.6993 |
| 2 | 5.0165 | 0.3623 | 3.78 | 0.5 | 3 | 4.3684 | 17.0271 |
| 3 | 3.3443 | 0.3623 | 3.78 | 0.5 | 3 | 4.3684 | 15.3550 |
| 4 | 1.6722 | 0.3623 | 3.78 | 0.5 | 3 | 4.3684 | 13.6828 |
| 5 | 0 | 0.3623 | 3.78 | 0.5 | 3 | 4.3684 | 12.0107 |

### 4.7 Control Prestress

### 4.7.1 Control PrestressForceafter Loss (Fi \& Fe)

 Prestress Forces will be control in three conditions:1. Transfer condition (right after jacking)

Elastic shortening and anchorage take-up loss will be occurred in this condition. Hence, Fo will be reduced by elastic shortening and slip anchorage loss.
2. Erection condition

Fo value is same as Fo in jacking condition but with different moment as consequent of erection precast. Shock factor (1.2) impacts Fo that occurred.

## 3. Service condition

All kind of load on slab work that makes some load combination, using moment in envelope combination. All losses include time dependent loss, use total loss of prestress to calculate Fo.

Because of total loss is around 20\%:
= Fo x $120 \%$
$=3,688,800 \mathrm{~N} \times 120 \%$
$=4,425,600 \mathrm{~N}$

1. Transfer/jacking/initial condition:

$$
\begin{aligned}
\mathrm{Fi} & =\mathrm{Fox}(1-(\mathrm{ES}+\mathrm{FS}+\mathrm{FL})) \\
& =4,425,600 \times(1-(0.07+0.03+4.4)) \\
& =3,803,543 \mathrm{~N} \\
\mathrm{M} & =8,100,000 \mathrm{Nmm}
\end{aligned}
$$

a. Top fiber stress:
$\mathrm{f}^{\mathrm{t}} \geq \mathrm{fc} 1$
$f^{t}=\frac{\mathrm{Fi}}{\mathrm{A}} \pm \frac{\mathrm{M} \times \mathrm{yt}}{\mathrm{I}}$
$f^{t}=-\frac{3,803,543}{7.5 \times 10^{5}}-\frac{8,100,000 \times 125}{1.17 \times 10^{10}}$
$f^{t}=-5.071-0.864$
$f^{t}=-5.935 \mathrm{MPa} \geq \mathrm{fc} 1=-30 \mathrm{MPa}(\mathrm{OK})$
b. Bottom fiber stress:
$\mathrm{f}^{\mathrm{b}} \leq \mathrm{ft} 1$
$f^{b}=\frac{\mathrm{Fi}}{\mathrm{A}} \pm \frac{\mathrm{M} \times \mathrm{yb}}{\mathrm{I}}$
$f^{b}=-\frac{3,803,543}{7.5 \times 10^{5}}+\frac{8,100,000 \times 125}{1.17 \times 10^{10}}$
$f^{b}=-5.071+0.864$

$$
f^{b}=-4.207 \mathrm{MPa} \leq \mathrm{ft} 1=3.536 \mathrm{MPa}(\mathrm{OK})
$$

2. Erection condition:

$$
\begin{aligned}
\hline \mathrm{Fi} & =\mathrm{Fo} \times(1-(\mathrm{ES}+\mathrm{FS})) \\
& =4,425,600 \times(1-(0.67+0.3)) \\
& =3,803,543 \mathrm{kN} \\
\mathrm{M} & =3,308,800 \mathrm{Nmm}
\end{aligned}
$$

a. Top fiber stress:
$\mathrm{f}^{\mathrm{t}} \geq \mathrm{fc} 1$
$f^{t}=\frac{\mathrm{Fi}}{\mathrm{A}} \pm \frac{\mathrm{M} \times \mathrm{yt}}{\mathrm{I}}$
$f^{t}=-\frac{3,803,543}{7.5 \times 10^{5}}-\frac{3,308,800 \times 125}{1.17 \times 10^{10}}$
$f^{t}=-5.071-0.0353$
$f^{t}=-5.107 \mathrm{MPa} \leq \mathrm{fc} 1=-30 \mathrm{MPa}(\mathrm{OK})$
b. Bottom fiber stress:
$\mathrm{f}^{\mathrm{b}} \leq \mathrm{ft} 1$
$f^{b}=\frac{\mathrm{Fi}}{\mathrm{A}} \pm \frac{\mathrm{M} \times \mathrm{yb}}{\mathrm{I}}$
$f^{b}=\frac{3,803,543}{7.5 \times 10^{5}}+\frac{3,308,800 \times 125}{1.17 \times 10^{10}}$
$f^{b}=-5.730+0.864$
$f^{b}=-5.036 \mathrm{MPa} \leq \mathrm{ft} 1=3.536 \mathrm{MPa}(\mathrm{OK})$
3. Service condition:

$$
\begin{aligned}
\mathrm{Fe} & =\mathrm{Fo} \times(1-(\text { Total Loss })) \\
& =4,425,600 \times(1-(0.187)) \\
& =3,598,094 \mathrm{kN} \\
\mathrm{M} & =599,400,000 \mathrm{Nmm}
\end{aligned}
$$

a. Top fiber stress:
$f^{t} \geq \mathrm{fc} 2$
$f^{t}=\frac{\mathrm{Fe}}{\mathrm{A}} \pm \frac{\mathrm{M} \times \mathrm{yt}}{\mathrm{I}}$
$f^{t}=\frac{3,598,094}{7.5 \times 10^{5}}-\frac{599,400,000 \times 125}{1.17 \times 10^{10}}$
$f^{t}=-4.797-6.3936$
$f^{t}=-11.191 \mathrm{MPa} \geq \mathrm{fc} 2=-22.5 \mathrm{MPa}(\mathrm{OK})$
b. Bottom fiber stress:

$$
\begin{aligned}
& f^{b} \leq \mathrm{ft} 2 \\
& f^{b}=\frac{\mathrm{Fe}}{\mathrm{~A}} \pm \frac{\mathrm{M} \times \mathrm{yb}}{\mathrm{I}} \\
& f^{b}=-\frac{3,598,094}{7.5 \times 10^{5}}+\frac{599,400,000 \times 125}{1.17 \times 10^{10}} \\
& f^{b}=-4.797+6.3936 \\
& f^{b}=1.596 \mathrm{MPa} \leq \mathrm{ft} 2=1.768 \mathrm{MPa}(\mathrm{OK})
\end{aligned}
$$

### 4.8 Total Tendon Requirement

- Use the minimum Fo $=4,425,600 \mathrm{~N}$
- Total strand (n)

$$
\begin{aligned}
& =\frac{\mathrm{F}}{\% \text { jacking } \times f p u \times A} \\
& =\frac{4,425,600}{0.8 \times 1770 \times 176.715} \\
& =20.83 \text { strands } \\
& \approx 25 \text { strands }
\end{aligned}
$$

- Total tendon ( 1 tendon $=5$ strands)

$$
\mathrm{n}=25 / 5=5 \text { tendons }
$$

- Distance between tendon
$=300 \mathrm{~cm} / 6=50 \mathrm{~cm}$

Figure 4.7Anchorage prestresstendon

### 4.9 Design Control

### 4.9.1 Punching Shear

- As consequences of forklift:

| Slab | $=3 \mathrm{~m} \times 6 \mathrm{~m}$ |
| :--- | :--- |
| Forklift | $=$ MHE MFD $($ Diesel $)$ |
|  | $=$ Wheelbase $=2.25 \mathrm{~m} \times 2.25 \mathrm{~m}$ |
|  | $=$ Load capacity $=8,160 \mathrm{~kg}$ |
| Critical area | $=3.375 \mathrm{~m} \times 3.375 \mathrm{~m}$ |

Figure 4.8 Punching shear area

Shear ultimate:

$$
\begin{aligned}
\mathrm{V}_{\mathrm{u}} & =\mathrm{V} \times \mathrm{SF} \\
& =8,160 \mathrm{~kg} \times 1.5 \\
& =12,240 \mathrm{~kg}
\end{aligned}
$$

Permissible shear: (basedon SNI 2847:2013 chap. 11.11.2.2)
$V_{c}=\left(\beta_{\mathrm{p}} \lambda \sqrt{\mathrm{f}^{\prime}{ }_{\mathrm{c}}}+0.3 \mathrm{f}_{\mathrm{pc}}\right) \mathrm{b}_{0} \mathrm{~d}+\mathrm{V}_{\mathrm{p}}$
where :

$$
\begin{aligned}
\beta & =\frac{\mathrm{Lx}}{\mathrm{Ly}}=\frac{2}{2}=1 \\
\lambda & =1 \text { (for normal weight concrete }) \\
\mathrm{b}_{\mathrm{o}} & =4 . \mathrm{s}=4 \times 337.5=1350 \mathrm{~cm}^{2} \\
\mathrm{~d} & =15 \mathrm{~cm}-2 . \operatorname{cover}=15-2(2.5)=10 \mathrm{~cm} \\
\mathrm{Vp} & =39,960 \mathrm{~kg} \\
\mathrm{f}_{\mathrm{pc}} & =47.97 \mathrm{MPa} \\
\mathrm{~V}_{\mathrm{c}} & =(1 . \sqrt{5000}+(0.3 \times 47.97) 1350.10+39.960 \\
& =212,141 \mathrm{~kg}
\end{aligned}
$$

Shear forces requirements
$\phi \mathrm{Vc}>\mathrm{Vu}$
$0.75(291,528)>12,240$
$218,646 \mathrm{~kg}>12,240 \mathrm{~kg}$ (OK)

### 4.10 Mild-Steel Reinforcement

Moment in YZ direction will be resisted by mild-steel reinforcement while moment in XZ is resisted by prestresstendon.

### 4.10.1 Design Specification

| Concrete strength, f'c | $=50 \mathrm{MPa}$ |
| :--- | :--- |
| Yield strength, fy | $=420 \mathrm{MPa}$ |
| Slab thickness, hf | $=250 \mathrm{~mm}$ |
| Decking concrete, d | $=25 \mathrm{~mm}$ |

(based on SNI 2847:2013 chap 7.72, decking concrete $\mathrm{d}=25 \mathrm{~mm}$ )

$$
\begin{array}{ll}
\text { Reinf.diameter, } \varnothing & =12 \mathrm{~mm} \\
\text { Lx } & =6000 \mathrm{~mm} \\
\text { Ly } & =3000 \mathrm{mmm} \\
\text { dy } & =\mathrm{hf}-\mathrm{d}-1 / 2 \mathrm{D} \\
& =250-25-1 / 2.12
\end{array}
$$

### 4.10.2 Stress Occurred

Table 4.13 Element Forces in X Direction

| YZ | Shear (kg) | Moment (kg/m2) |  |
| :--- | ---: | ---: | :---: |
|  |  | $\mathbf{M +}$ | $\mathbf{M}-$ |
| DL | 2700 | 2025 | - |
| D erection | 1582.2 | 348.3 | 347.08 |
| DL+LL | 19980 | 14985 | - |

Mild-steel reinforcement will be design to resist moment. The top reinforcement will resist negative moment from erection, and the bottom reinforcement will resist positive moment from service load.

### 4.10.3 Reinforcement Needed Calculation

$\mathrm{As}_{\phi} \quad=\frac{1}{4} \times \pi \times \mathrm{D}^{2}=\frac{1}{4} \times \pi \times 12^{2}=113.1 \mathrm{~mm}^{2}$
(based on SNI 2857:2013 chap. 7.12.2.1)
$\rho_{\text {shrinkage }} \quad=0.0018$ (for slab)
(based on SNI 2857:2013 chap. 7.12.2.1)
reduction factor for flexural reinforcement, $\phi=0.9$

## 4. 10.3.1 Reinforcement for Service (bottom)

$\mathrm{Mu} \quad=14,985 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{14,985}{0.9}=16,665 \mathrm{kgm}$
Rn $\quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{16,665}{1 \mathrm{~m} \times 0.219^{2}}=3.472 \times 10^{5} \mathrm{~kg} / \mathrm{m}^{2}$
$=3.472 \mathrm{~N} / \mathrm{mm}^{2}$

$$
\begin{aligned}
\rho_{\text {perlu }} & =\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right) \\
& =\frac{0.85 \times 50}{350}\left(1-\sqrt{1-\frac{2 \times 3,472}{0.85 \times 50}}\right) \\
& =9.912 \times 10^{-7}\left(\text { use } \rho_{\mathrm{min}}\right) \\
\mathrm{As}_{\text {need }} & =\rho_{\text {shrinkage }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dy} \\
& =0.0018 \times 1 \mathrm{~m} \mathrm{x} 0.219 \mathrm{~m} \\
& =3.942 \times 10^{-4} \mathrm{~m}^{2} \\
& =3942 \mathrm{~mm}^{2}
\end{aligned}
$$

Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As} s_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{394.2}{113.1}=3.485$
use 4 reinforcements

Space of reinforcements:
$\mathrm{n} \quad=\frac{1 \mathrm{~m}}{4}=250 \mathrm{~mm}$
useD12-250mm

## 4. 9.3.2 Reinforcement for Erection (top)

$\mathrm{Mu} \quad=347.08 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{347.08}{0.9}=385.644 \mathrm{kgm}$
$\mathrm{Rn} \quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{385.644}{1 \mathrm{~m} \times 0.219^{2}}=8.041 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2}$
$=0.08041 \mathrm{~N} / \mathrm{mm}^{2}$
$\rho_{\text {perlu }} \quad=\frac{0.85 \times f \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
\begin{aligned}
& =\frac{0.85 \times 50}{350}\left(1-\sqrt{1-\frac{2 \times 0.08041}{0.85 \times 50}}\right) \\
& =8.493 \times 10^{-5}\left(\text { use } \rho_{\min }\right) \\
& =\rho_{\text {shrinkage }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dy} \\
& =0.0018 \times 1 \mathrm{~m} \times 0.219 \mathrm{~m} \\
& =3.942 \times 10^{-4} \mathrm{~m}^{2} \\
& =3942 \mathrm{~mm}^{2}
\end{aligned}
$$

Total reinforcement:

$$
\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{394.2}{113.1}=3.485
$$

use 4 reinforcements

Space of reinforcements:

$$
\mathrm{n} \quad=\frac{1 \mathrm{~m}}{4}=250 \mathrm{~mm}
$$

useD12-250mm

Figure 4.9 Cross section of $X$ direction

## CHAPTER 5 MACHINE FOUNDATION

### 5.1 Soil Investigation Analysis

Soil investigation analysis was calculated based on data from Geotechnical Investigation Report.

With N correction:

1. Toward Groundwater (N') according to Terzaghi\& Peck :
$\mathrm{N}^{\prime}=15+0.5(\mathrm{~N}-15)$, for $\mathrm{N}>15$
$\mathrm{N}^{\prime}=1.25$ for gravel or sandy gravel
2. Toward Soil Overburden Pressure $\left(\mathrm{N}_{2}\right)$ :

$$
\begin{array}{lll}
\mathrm{N}_{2}=\frac{4 . \mathrm{N}_{1}}{1+\left(0.4 . \rho_{0}\right)} & \text { if } & \rho_{0} \leq 7.5 \mathrm{ton} / \mathrm{m}^{2} \\
\mathrm{~N}_{2}=\frac{4 . \mathrm{N}_{1}}{3.25+\left(1.4 \times \rho_{0}\right)} & \text { if } & \rho_{0} \geq 7.5 \mathrm{ton} / \mathrm{m}^{2}
\end{array}
$$

$\rho_{0}=$ vertical soil pressure at a depth which is reviewed. $\mathrm{N}_{2}$ value is should be $\leq 2 \mathrm{~N}_{1}$, if the correction is obtained that
$\mathrm{N}_{2}>2 \mathrm{~N}_{1}$, use $\mathrm{N}_{2}=\mathrm{N}_{1}(\rho \mathrm{o}=\gamma \mathrm{txh}) / \mathrm{m} 2$ for silty clay
$25 \mathrm{t} / \mathrm{m} 2$ for sandy silt
$40 \mathrm{t} / \mathrm{m} 2$ for sand
$\mathrm{qp}=$ Tegangandiujungtiang
$\mathrm{Ap}=$ Section area pile
Qs $=\mathrm{qs} \mathrm{x}$ As

$$
=\beta \times\left(\frac{\mathrm{Ns}}{3}+1\right) \times \mathrm{As}
$$

Where:
$\beta=$ Shaft coefficient intermediate soils for driven pile $=1$
$\mathrm{Ns}=$ SPT average for planted pile, boundary $3 \leq \mathrm{N} \leq 50$
As = Luasselimuttiangtertanam
$\mathrm{qs}=$ Teganganakibatgesertiang

### 5.2 Allowable Bearing Capacity

Lucciano De'Court method will be used for the clayey soil

$$
\begin{aligned}
& \mathrm{Q}=\quad \mathrm{Qp}+\mathrm{Qs} \\
& \text { Where: }
\end{aligned}
$$

$\mathrm{Ql}=$ Allowable bearing capacity of pile
$\mathrm{Qp}=$ Ultimate resistance at the end of pile
Qs = Ultimate resistance at the skin of pile

$$
\begin{array}{ll}
\mathrm{Qp} \quad & =q p \times \quad \mathrm{Ap} \\
& =\alpha \times \mathrm{Np} \times \mathrm{K} \times \mathrm{Ap}
\end{array}
$$

Where:
$\alpha=$ Base coefficient intermediate soil for driven pile $=1$
$\mathrm{Np}=\mathrm{SPT}$ average for 4B upper till 4B bellow pile ( B is pile diameter)
K = Soil characteristic coefficient
$12 \mathrm{t} / \mathrm{m} 2$ for clay
$20 \mathrm{t} / \mathrm{m} 2$ for silty clay
$25 \mathrm{t} / \mathrm{m} 2$ for sandy silt
$40 \mathrm{t} / \mathrm{m} 2$ for sand
$\mathrm{qp}=$ Stress at the end of pile
$\mathrm{Ap}=$ Section area pile

$$
\begin{aligned}
\mathrm{Qs} & =\mathrm{qs} \times \mathrm{As} \\
& =\beta \times\left(\frac{\mathrm{Ns}}{3}+1\right) \times \mathrm{As}
\end{aligned}
$$

Where:
$\beta=$ Shaft coefficient intermediate soils for driven pile $=1$
$\mathrm{Ns}=$ SPT average for planted pile, boundary $3 \leq \mathrm{N} \leq 50$
As $=$ Total area of pile
$\mathrm{qs}=$ shear stress of pile

## Allowable Bearing Capacity vs Deep

Figure 5.1 Graphic of Allowable Bearing Capacity vs Depth

### 5.3 Load and Load Combinations

Figure 5.2 Plan Side Machine Foundation

## Dynamic forces work in section A-A

Figure 5.3 Cross Section A-A of Machine Foundation

## a. Death Load

- Concrete selfweight
$=24 \mathrm{kN} / \mathrm{m}^{3} \times 24 \mathrm{~m} \times 12 \mathrm{mx} 1 \mathrm{~m}$
$=6,912 \mathrm{kN}$

## b. Live Load

- Live Load
$=25 \mathrm{kN} / \mathrm{m}^{2} \times 12 \mathrm{mx} 6 \mathrm{~m}$
$=1,800 \mathrm{kN}$

## c. Machine Load 1 \& 2

- Machine self weight (V) $=110 \mathrm{kN}$
- Horizontal Force (Hy) $\quad=66 \mathrm{kN}$
- Vertical Force (Hz) $=144 \mathrm{kN}$

### 5.3.2 Load Combination

According to there are various approach to analyze load combinations, the normal operations will be used in this section (based on ACI 351 3R-04, Foundation for Dynamic Equipment).

1. Dead Load
2. Dead load + thermal load + machine forces + live loads + wind + snow (thermal andsnow load are supposed to be zero, while wind load will be resisted by upper structure)
3. Dead load + thermal load + machine forces + seismic load + snow (thermal and snow load are supposed to be zero, seismic load will be resisted by upper structure)

### 5.3.3 Static Load Analysis

Table 5.5 Load Combination of Static Load

| Loading | V |  |
| :--- | ---: | ---: |
|  | kN | ton |
| Dead Load (D) | 6912 | 691.2 |
| Live Load (L) | 1800 | 180 |
| Machine Force (F1) | 110 | 11 |
| Machine Force (F2) | 110 | 11 |

Combination 1

| LOAD | FACTOR | FORCES (ton) | DISTANCE (m) | MOMENT (ton.m) |
| :---: | ---: | :---: | :---: | :---: |
|  |  | $\mathbf{V}$ | $\mathbf{Y}$ | $\mathbf{M x}$ |
| Dead Load | 1 | 691.2 |  |  |
| Total |  |  | 691.2 |  |

Combination 2
$=\quad D+L+F$

| LOAD | FACTOR | FORCES (ton) | DISTANCE (m) | MOMENT (ton.m) |
| :--- | ---: | :---: | ---: | ---: |
|  |  | $\mathbf{V}$ | $\mathbf{Y}$ | $\mathbf{M x}$ |
| Dead Load | 1 | 691.2 |  |  |
| Live Load | 1 | 180 |  | 3 |
| Machine Force (F1) | 1 | 11 |  | 33 |
| Machine Force (F2) | 1 | 11 | -3 | -33 |
| Total |  |  | 893.2 |  |

Combination 3
$=\quad \mathrm{D}+\mathrm{F}$

| LOAD | FACTOR | FORCES (ton) | DISTANCE (m) | MOMENT (ton.m) |
| :---: | ---: | ---: | ---: | ---: |
|  |  | $\mathbf{V}$ | $\mathbf{Y}$ | $\mathbf{M x}$ |
| Dead Load | 1 | 691.2 |  |  |
| Machine Force (F1) | 1 | 11 | 3 | 33 |
| Machine Force (F2) | 1 | 11 | -3 | -33 |
| Total |  |  | 702.2 |  |

### 5.3.4 Dynamic Load Analysis

| Loading | V |  | Hz |  | Hy |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | kN | ton | kN | ton | kN | ton |
| Dead Load (D) | 6912 | 691.2 |  |  |  |  |
| Live Load (L) | 1800 | 180 |  |  |  |  |
| Machine Force 1 (F1) | 110 | 11 | 144 | 14.4 | 66 | 6.6 |
| Machine Force 2 (F2) | 110 | 11 | 144 | 14.4 | 66 | 6.6 |

Table 5.6 Load Combination of Dynamic Load (Both of Machine Work in the Same Direction)

## Both of Machine Work ( in the same direction)

| Combination 2 |  | D+L+F |  |  |  |  |  |  |  |

### 5.4 Pile Analysis

a. Maximum load for every pile
$P_{\text {max }}=\frac{\mathrm{V}}{\mathrm{n}}+\frac{\mathrm{M}_{\mathrm{x}} \times \mathrm{Y}_{\text {max }}}{\sum \mathrm{Y}_{2}}+\frac{\mathrm{M}_{\mathrm{y}} \times \mathrm{X}_{\text {max }}}{\sum \mathrm{x}_{2}}$
Where:
$\mathrm{P}_{\text {max }} \quad=$ Maximum load for one pile
$\Sigma \mathrm{P}=$ Total axial load occurred
$\mathrm{Mx} \quad=$ Moment in X direction
My $\quad=$ Moment in Y direction
Xmax $=$ Absistiangpancangterjauhterhadapgaris beratkelilingtiang $=9.6 \mathrm{~m}$
Ymax = Ordinattiangpancangterjauhterhadapgaris beratkelilingtiang $=4 \mathrm{~m}$
$\Sigma X^{2}=$ Jumlahkuadratabsistiangpancangterhadap garisberatkelompoktiang
$=\left(8 \times 2.4^{2}\right)+\left(8 \times 4.8^{2}\right)+\left(8 \times 7.2^{2}\right)+\left(8 \times 9.6^{2}\right)$
$=1382.4 \mathrm{~m}^{2}$
$\sum \mathrm{Y}^{2}=$ Jumlahkuadratordinattiangpancangterhadap garisberatkelompoktiang
$=\left(18 \times 2^{2}\right)+\left(18 \times 4^{2}\right)$
$=360 \mathrm{~m}^{2}$
n $\quad=$ total of pile $=48$
b. Efficiency number::
$\mathrm{Pb}=29,974.219$ ton
P1 $=33.703$ ton
Equation for efficiency:
$\eta=\sqrt{\frac{\mathrm{Pb}^{2}}{\mathrm{~Pb}^{2}+\mathrm{nP}^{2}}}$
$=\sqrt{\frac{29,974.219^{2}}{29,974.219^{2}+(48 \times 33.703)^{2}}}$
$=0.9985$

## Table 5.8 Q allowable $(Q g r o u p)(B=10.4 m)$

Lateral forces efficiency/reduction

$$
\begin{gathered}
\mathrm{n}_{\mathrm{h}}=\mathrm{ks} \times \xi=1.44 \times 0.64= \\
0.9216 \mathrm{~cm}^{3}
\end{gathered}
$$

where:
$\mathrm{ks}=1.44$
$\xi=$ efficiency/reduction modulus of pile group
$=\frac{\text { Total cumulative efficiency }}{\mathrm{n} \times \text { Qall }}$
$=\frac{1041.424}{48 \times 33.703}=0.64$
$=64 \%$

80

$$
\mathrm{T}=\sqrt[5]{\frac{\mathrm{E}_{\mathrm{p}} \cdot \mathrm{I}_{\mathrm{p}}}{\mathrm{n}_{\mathrm{h}}}}
$$

where:

$$
\begin{aligned}
\mathrm{E}_{\mathrm{p}} & =200,000 \mathrm{MPa} \\
\mathrm{I}_{\mathrm{p}} & =125,091.15 \mathrm{~cm}^{4} \\
\mathrm{n}_{\mathrm{h}} & =0.9216 \\
\mathrm{~T}= & \sqrt[5]{\frac{200,000 \times 125,091.15}{0.9216}}=122.1 \mathrm{~cm} \\
& \mathrm{M}=\left(\mathrm{A}_{\mathrm{m}}-0.93 \mathrm{~B}_{\mathrm{m}}\right) \cdot \mathrm{Q}_{\mathrm{q}} \cdot \mathrm{~T}
\end{aligned}
$$

where:

$$
\begin{aligned}
\mathrm{A}_{\mathrm{m}} & =\text { Table } 6-2 \text { (PondasiBebanDinamis chap VI) } \\
& =1 \text { (right on surface) } \\
\mathrm{B}_{\mathrm{m}} & =\text { Table } 6-1 \text { (PondasiBebanDinamis chap VI) } \\
& =1 \text { (right on surface) } \\
\mathrm{Q}_{\mathrm{q}} & =6 \text { ton }+6 \text { ton }=12 \text { ton } \\
\mathrm{T} & =122.1 \mathrm{~cm}=1.22 \mathrm{~cm} \\
\mathrm{M} & =\left(\mathrm{A}_{\mathrm{m}}-0.93 \mathrm{~B}_{\mathrm{m}}\right) \cdot \mathrm{Q}_{\mathrm{q}} \cdot \mathrm{~T} \\
& =(1-(0.93 \times 0)) \times 12 \times 1.22 \\
& =1.025 \mathrm{tm}
\end{aligned}
$$

Compare moment:

$$
\mathrm{M}_{\text {pile }}=6.3 \mathrm{tm}>\mathrm{M}_{\text {lateral }}=1.025 \mathrm{tm}(\mathrm{OK})
$$

The value of $M$ lateral is really small because it's just machine force without earthquake force.

### 5.5.2 Buckling check:

$$
\frac{\mathrm{Ip}}{\mathrm{~A}^{2}}>\frac{\sigma_{\max }^{2}}{4 . \text { nh.d.Ep }}
$$

$$
\begin{aligned}
& \text { Ip } \quad=125,091.15 \mathrm{~cm}^{4} \\
& \mathrm{~A} \quad=\frac{1}{4} \pi \mathrm{D}^{2}=\frac{1}{4} \pi 40^{2}=2,010,619 \mathrm{~cm}^{2} \\
& \sigma_{\max }^{2} \quad=\left(\frac{\mathrm{P}}{\mathrm{~A}}\right)^{2}=\left(\frac{129000}{\pi .20^{2}}\right)^{2}=10538 \mathrm{~kg} \cdot \mathrm{~cm} \\
& \mathrm{n}_{\mathrm{h}} \quad=0.9216 \mathrm{~kg} / \mathrm{cm}^{3} \\
& \mathrm{~d} \quad=40 \mathrm{~cm} \\
& \mathrm{Ep} \quad=200,000 \mathrm{MPa} \\
& \begin{aligned}
\frac{125,091.15}{2,010,619^{2}}>\frac{10,538}{4 \times 0.9216 \times 40 \times 200,000} \\
0.0622>0.000357(\mathrm{OK})
\end{aligned}
\end{aligned}
$$

Because $0.0622>0.000357$, the buckling will not happen

### 5.6 Pile Cap

Figure 5.4 Piling location of machine foundation

### 5.6.1 Punching Shear Control

Punching shear of slab will be checked with thickness $\mathrm{hf}=$ 1 m as consequence of pile loacation previous design. With the permissible stress:

Punching Shear (as a consequence of pile)

Figure 5.5 Punching shear

Shear ultimate:

$$
\begin{aligned}
\mathrm{V}_{\mathrm{u}} & =\mathrm{Q}_{\text {all }} \mathrm{x} \mathrm{SF} \\
& =33.703 \text { ton } \times 1.5 \\
& =50.55 \text { ton } \\
& =50,550 \mathrm{~kg}
\end{aligned}
$$

Permissible shear: (based on SNI 2847:2013 chap. 11.11.2.1)
$\mathrm{V}_{\mathrm{c}}=0.17\left(1+\frac{2}{\beta}\right) \lambda\left(\sqrt{\mathrm{f}^{\prime} \mathrm{c}}\right) \mathrm{b}_{\mathrm{o}} \mathrm{d}$ or
$\mathrm{V}_{\mathrm{c}}=0.33 \lambda \sqrt{f_{c}^{\prime}}{ }_{c} b_{o} d$
where,
$\beta=\frac{\mathrm{Lx}}{\mathrm{Ly}}=\frac{24}{12}=2$

$$
\begin{aligned}
\lambda= & (\text { for normal weight concrete) } \\
\mathrm{b}_{\mathrm{o}}= & \pi \mathrm{D}^{2}=\pi .80=251.33 \mathrm{~cm}^{2} \\
\mathrm{~d}= & 1 \mathrm{~m}=100 \mathrm{~cm}
\end{aligned} \quad \begin{aligned}
\mathrm{V}_{\mathrm{c}} & =0.17\left(1+\frac{2}{2}\right) \sqrt{5000} 251.33 .90 \\
& =543,814 \mathrm{~kg} \\
\mathrm{~V}_{\mathrm{c}} & =0.33 \sqrt{5000} 251.33 .90 \\
& =527,819 \mathrm{~kg}
\end{aligned}
$$

Shear forces requirements
$\phi \mathrm{Vc}>\mathrm{Vu}$
$0.75(527,819)>50,550$
$395.864 \mathrm{~kg}>50,550 \mathrm{~kg}$ (OK)

### 5.6.2 Design Specification

Concrete strength, f'c
Yield strength, fy $=350 \mathrm{MPa}$
Slab thickness, hf $\quad=1 \mathrm{~m}$
Decking concrete, $\mathrm{d}=50 \mathrm{~mm}$
(based on SNI 2847:2013 chap.7.7.3, d=50 mm)
Reinf.diameter, D

$$
=25 \mathrm{~mm}
$$

$=12 \mathrm{~m}$
Ly
$=24 \mathrm{~m}$
$=h f-\mathrm{d}-(1 / 2) \mathrm{D}$
$=1000-50-(1 / 2) .25$
$=938 \mathrm{~mm}$
dy
$=1000-50-(3 / 2) .25$
$=913 \mathrm{~mm}$

### 5.6.3 Stress Occurred

Figure 5.6 $M_{11}$ for reinforcement

Figure $5.7 M_{11}$ for reainforcement

Table 5.11 Element forces of slab with envelope combination

| Combination | Moment (kgm) |  | Shear (kg) |  |
| :--- | ---: | ---: | ---: | ---: |
|  | M11 | M22 | V13 | V23 |
| Envelope | -7648.71 | -1573.07 | -3155.61 | -398 |
| Envelope | -7498.45 | -768.88 | -3155.92 | -398 |

| Envelope | -3664.49 | -375.75 | -1542.3 | -194.5 |
| Envelope | 924.68 | 118.45 | -3155.61 | -398.19 |
| Envelope | 998.57 | 511.64 | -3155.92 | -398.19 |
| Envelope | 1892.12 | 242.38 | -1542.14 | -194.59 |
| Envelope | 2043.31 | 1046.94 | -1542.3 | -194.59 |

### 5.6.4 Reinforcement Needed Calculation

As $_{\mathrm{D}} \quad=\frac{1}{4} \times \pi \times \mathrm{D}^{2}=\frac{1}{4} \times \pi \times 25^{2}=490.9 \mathrm{~mm}^{2}$
(based SNI 2847:2013 chap. 10.2.7.3)
(based on SNI 2857:2013 chap. 7.12.2.1)
$\rho_{\text {shrinkage }} \quad=0.0018$
(based on SNI 2857:2013 chap. 7.12.2.1) reduction factor of reinforcement, $\phi \quad=0.9$

### 5.6.4.1 Reinforcement for $\mathbf{X}$ direction (M11)

a. Positive Moment (Top)

$$
\begin{array}{ll}
\mathrm{Mu} & =2,043.31 \mathrm{kgm} \\
\mathrm{Mn} & =\frac{\mathrm{Mu}}{\phi}=\frac{2,043.31}{0.9}=2,279 \mathrm{kgm} \\
\mathrm{Rn} & =\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=\frac{2,279}{1 \mathrm{~m}^{\times 0} 0^{2} 938^{2}}=2.583 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2} \\
& =0.02583 \mathrm{~N} / \mathrm{mm}^{2}
\end{array}
$$

$\rho_{\text {perlu }}$

$$
\begin{aligned}
& =\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right) \\
& =\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.02583}{0.85 \times 30}}\right) \\
& =7.384 \times 10^{-5}\left(\text { use } \rho_{\mathrm{min}}\right) \\
& =\rho_{\text {susut }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dx} \\
& =0.0018 \times 1 \mathrm{~m} \mathrm{x} 0.938 \mathrm{~m} \\
& =1.688 \times 10^{-3} \mathrm{~m}^{2} \\
& =1688 \mathrm{~mm}^{2}
\end{aligned}
$$

$$
\mathrm{As}_{\text {need }} \quad=\rho_{\text {susut }} \times 1 \mathrm{mx} \mathrm{dx}
$$

## Total reinforcement:

$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\mathrm{D}}}=\frac{1688}{490.9}=3.438$ (use 4 reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=250 \mathrm{~mm}$

## useD25-250mm

b. Negative Moment(bottom)
$\mathrm{Mu} \quad=7,648.71 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{7.648 .71}{0.9}=8,499 \mathrm{kgm}$
Rn

$$
=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=\frac{8,499}{1 \mathrm{~m} \times 0_{0} 9^{2}}=1.049 \times 10^{4} \mathrm{~kg} / \mathrm{m}^{2}
$$

$$
=0.01049 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\rho_{\text {perlu }} \quad=\frac{0.85 \times f \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
=\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.01049}{0.85 \times 30}}\right)
$$

$$
=3.066 \times 10^{-4}\left(\text { use } \rho_{\min }\right)
$$

$\mathrm{As}_{\text {need }} \quad=\rho_{\text {susut }} \times 1 \mathrm{mx} \mathrm{dx}$

$$
=0.0018 \times 1 \mathrm{~m} \times 0.938 \mathrm{~m}
$$

$$
=1.688 \times 10^{-3} \mathrm{~m}^{2}
$$

$$
=1688 \mathrm{~mm}^{2}
$$

Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As} s_{\mathrm{D}}}=\frac{1688}{490.9}=3.438$ (use 4 reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=250 \mathrm{~mm}$
useD25-250mm

### 5.6.4.2 Reinforcement for Y direction (M22)

a. Positive Moment (Top)
$\mathrm{Mu} \quad=1,046.94 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{1,046.94}{0.9}=1,163 \mathrm{kgm}$
Rn

$$
=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{1,163}{1 \mathrm{~m} \times 0.913^{2}}=1.387 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2}
$$

$$
=0.001387 / \mathrm{mm}^{2}
$$

$\rho_{\text {perlu }} \quad=\frac{0.85 \times f \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$

## CHAPTER 6 COLUMN FOUNDATION

### 6.1. Soil Investigation Analysis

Soil investigation analysis was calculated based on data from Geotechnical Investigation Report.

With N correction:

1. Toward Groundwater ( $\mathrm{N}^{\prime}$ ) according to Terzaghi\& Peck :
$\mathrm{N}^{\prime}=15+0.5(\mathrm{~N}-15)$, for $\mathrm{N}>15$
$\mathrm{N}^{\prime}=1.25$ for gravel or sandy gravel
2. Toward Soil Overburden Pressure $\left(\mathrm{N}_{2}\right)$ :
$\begin{array}{lll}\mathrm{N}_{2}=\frac{4 . \mathrm{N}_{1}}{1+\left(0.4 . \rho_{0}\right)} & \text { if } & \rho_{0} \leq 7.5 \mathrm{ton} / \mathrm{m}^{2} \\ \mathrm{~N}_{2}=\frac{4 . \mathrm{N}_{1}}{3.25+\left(1.4 \times \rho_{0}\right)} & \text { if } & \rho_{0} \geq 7.5 \mathrm{ton} / \mathrm{m}^{2}\end{array}$
$\rho_{0}=$ vertical soil pressure at a depth which is reviewed. $\mathrm{N}_{2}$ value is should be $\leq 2 \mathrm{~N}_{1}$, if the correction is obtained that $\mathrm{N}_{2}>2 \mathrm{~N}_{1}$, use $\mathrm{N}_{2}=\mathrm{N}_{1}(\rho \mathrm{o}=\gamma \mathrm{t} \mathrm{xh}) / \mathrm{m} 2$ for silty clay
$25 \mathrm{t} / \mathrm{m} 2$ for sandy silt

$$
40 \mathrm{t} / \mathrm{m} 2 \text { for sand }
$$

$\mathrm{qp}=$ Tegangandiujungtiang
$\mathrm{Ap}=$ Section area pile
Qs $=\mathrm{qs} \times \mathrm{x}$ As

$$
=\beta \times\left(\frac{\mathrm{Ns}}{3}+1\right) \times \mathrm{As}
$$

Where:
$\beta=$ Shaft coefficient intermediate soils for driven pile $=1$
$\mathrm{Ns}=$ SPT average for planted pile, boundary $3 \leq \mathrm{N} \leq 50$
As = Luasselimuttiangtertanam
$\mathrm{qs}=$ Teganganakibatgesertiang

### 6.2. Allowable Bearing Capacity of Pile

LuccianoDe'Court method will be used for the clayey soil

$$
\mathrm{Ql}=\mathrm{Qp}+\mathrm{Qs}
$$

where:

$$
\begin{aligned}
\text { Qp } \quad & =\mathrm{qp} \times \mathrm{Ap} \\
& =\alpha \times \mathrm{Np} \times \mathrm{K} \times \mathrm{Ap} \\
\text { Qs } \quad & =\mathrm{qs} \times \mathrm{As} \\
& =\beta \times\left(\frac{\mathrm{Ns}}{3}+1\right) \times \mathrm{As}
\end{aligned}
$$

There are some diameters pile will be used for column foundation for interior and exterior column. Table 6.2 and Table 6.3 shows the allowable bearing capacity of pile with diameter 20 cm and 30 cm . And there are graphics that illustrate comparison of shear, end bearing capacity and maximum force that can be resisted.

Diameter and end-bearing area of pile:

| Type | D (m) | Ap |
| :---: | :---: | :---: |
| spunpile | 0.2 | 0.031416 |
| spunpile | 0.3 | 0.070686 |

Figure 6.2 Graphic of Allowable Bearing Capacity Pile D-30cm

## 98

### 6.3. Stress Distribution of Column

Stress distribution should be analyzed to get part of the floor dead load of precast that will be resisted by pile cap.

Figure 6.3 Estimation of Stress Distribution from Precast
From the picture, coordinate of stress precast was gotten:

$$
\begin{aligned}
& \mathrm{x}=1.5 \mathrm{~m} ; \mathrm{y}=3 \mathrm{~m} \\
& \mathrm{z}=0.5 \mathrm{~m} \text { (thickness of pile cap) } \\
& \mathrm{m}=\frac{\mathrm{x}}{\mathrm{z}}=\frac{1.5}{0.5}=3 ; \mathrm{n}=\frac{\mathrm{y}}{\mathrm{z}}=\frac{3}{0.5}=6
\end{aligned}
$$

Figure 6.4 Graphic I factor for distributed area load

From the graphic, faktorpengaruh I is gotten $=0.155$, because there are 4 precast, so I total $=\mathrm{I} \mathrm{x} 4=0.155 * 4=0.62$ Finally, the floor dead load could be calculated:

$$
\begin{gathered}
\mathrm{FD}=\mathrm{I}_{\text {total }} \times \mathrm{V} \times \gamma_{\text {concrete }} \\
\mathrm{FD}=0.62 \times(6 \times 3 \times 0.25) \times 2400 \\
\mathrm{FD}=6696 \mathrm{kN}=6.696 \text { ton }
\end{gathered}
$$

### 6.4. Load and Load Combination

Analyzing of load and load combination are differences by two types of column, interior and exterior column. The columns are steel structure with the internal forces that had been calculated by consultant. The foundation, include pile cap and pile, will be calculated without approximating the strength of steel, steel strength is supposed strong enough to resist forces without failed.

There are some load combinations according to SNI, but the factor won't be used to calculate the pile:

1. D
2. $\mathrm{D}+\mathrm{L}+\mathrm{R}$
3. $\mathrm{D}+\mathrm{R}+\mathrm{W}$
4. $\mathrm{D}+\mathrm{W}+\mathrm{L}+\mathrm{R}$
5. $\mathrm{D}+\mathrm{E}+\mathrm{R}$
6. $\mathrm{D}+\mathrm{W}$
7.D+E

### 6.4.1. Interior Column

Theinterior column that will be analyzed is column in grid E-10 as shown in Table 6.4.

Table 6.4 Output Forces of Interior Column

| Type |  | Interior Column |  |
| :---: | :---: | :---: | :---: |
| Grid1 - Grid2 |  | E-10 |  |
| Base Plate | (mm) | $330 \times 330$ |  |
| Base Plate T | (mm) | 20 |  |
| Anchor Rod | m. (mm) | 4-24.0 |  |
| Column Base Elev. |  | -425 |  |

### 6.5 Pile Analysis

Pile analysis differences by interior and exterior column. The design of both pile are different based on the loading as seen in Figure 6.5 and Figure 6.6. The comparison between the real load and the design are checked in Table 6.10 and Table 6.11.

### 6.5.1 Interior Column

For the interior column, pile with diameter, $\mathrm{d}=25 \mathrm{~cm}$ will be used.

| pile cap | $=2 \mathrm{~m} \times 2 \mathrm{~m}$ |
| :--- | :--- |
| t pile cap | $=50 \mathrm{~cm}$ |
| type pile | $=$ spun pile |
| d pile | $=25 \mathrm{~cm}$ |

a. Load of one pile:

$$
P_{\text {max }}=\frac{\mathrm{V}}{\mathrm{n}}+\frac{\mathrm{M}_{\mathrm{x}} \times \mathrm{Y}_{\text {max }}}{\sum \mathrm{Y}_{2}}+\frac{\mathrm{M}_{\mathrm{y}} \times \mathrm{X}_{\text {max }}}{\Sigma \mathrm{x}_{2}}
$$

Where:

| $\mathrm{P}_{\max }$ | $=$ Maximum load for one pile |
| :--- | :--- |
| $\Sigma \mathrm{P}$ | $=$ Total axial load occurred |
| Mx | $=$ Moment in X direction |
| My | $=$ Moment in Y direction |
| $\mathrm{X} \max$ | $=0.5 \mathrm{~m}$ |
| Ymax | $=0.5 \mathrm{~m}$ |

| $\sum X^{2}$ | $=4 \times 0.5^{2}=1 \mathrm{~m}^{2}$ |
| :--- | :--- |
| $\sum \mathrm{Y}^{2}$ | $=4 \times 0.5^{2}=1 \mathrm{~m}^{2}$ |
| n | $=$ total of pile $=4$ |

b. Efficiency:

Efficiency of pile considered as the previous chapter based on the good soil condition.
$\eta=0.9$
$Q$ allowable $=$
Q allowable pile x $\eta \times 0.6$ (static factor for static pile)

Checking:
Q allowable > P max
Table 6.10 Checking of P max and Q allowable for Interior Column

| COMBO | FORCES (ton) |  |  | MOMENT |  | EP/n | $\begin{gathered} \text { (Mx x Ymax) } \\ / \Sigma \mathrm{Y} 2 \end{gathered}$ | $\begin{gathered} \text { (My x Xmax) } \\ / \text { IX2 } \end{gathered}$ | $\begin{aligned} & \text { Pmax } \\ & \text { (ton) } \end{aligned}$ | Q allowable (D-25cm) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | V | Hz | Hy | Mx | My |  |  |  |  |  |

## c. Punching Shear

1. Two way slab punching shear

- As consequences of column:

Steel column = WF 330x330
Pedestal column $=500 \times 500$
Pile cap $\quad=2 \mathrm{~m} \times 2 \mathrm{~m}$

Shear ultimate:

$$
\begin{aligned}
\mathrm{V}_{\mathrm{u}} & =\mathrm{V} \times \mathrm{SF} \\
& =18.546 \text { ton } \times 1.5 \\
& =27.819 \mathrm{ton} \\
& =27,819 \mathrm{~kg}
\end{aligned}
$$

Permissible shear:
(based on SNI 2847:2013 chap. 11.11.2.1)

$$
\mathrm{V}_{\mathrm{c}}=0.17\left(1+\frac{2}{\beta}\right) \lambda\left(\sqrt{\mathrm{f}^{\prime} \mathrm{c}}\right) \mathrm{b}_{\mathrm{o}} \mathrm{~d}
$$

or

$$

### 4.9.3 Reinforcement Needed Calculation

Because of the symmetric design, reinforcement in x and y direction will have the same reinforcement needed. So it will be differences by negative and positive moment.

$$
\mathrm{As}_{\phi} \quad=\frac{1}{4} \times \pi \times \mathrm{D}^{2}=\frac{1}{4} \times \pi \times 20^{2}=0.03142 \mathrm{~mm}^{2}
$$

(based on SNI 2857:2013 chap. 7.12.2.1)
$\rho_{\text {shrinkage }} \quad=0.0018$ (for slab)
(based on SNI 2857:2013 chap. 7.12.2.1)
reduction factor of reinforcement, $\phi \quad=0.9$

## 4. 9.3.1 Reinforcement for $X$ Direction

a) Positive Moment

$$
\begin{aligned}
\mathrm{Mu} & =64.35 \mathrm{kgm} \\
\mathrm{Mn} & =\frac{\mathrm{Mu}}{\phi}=\frac{64.35}{0.9}=71.5 \mathrm{kgm} \\
\mathrm{Rn} & =\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=\frac{71.5}{1 \mathrm{~m} \times 0.7^{2}}=145.918 \mathrm{~kg} / \mathrm{m}^{2} \\
& =0.00145 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

$\rho_{\text {perlu }}$

$$
\begin{aligned}
\rho_{\text {perlu }} & =\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right) \\
& =\frac{0.85 \times 50}{350}\left(1-\sqrt{1-\frac{2 \times 0.00145}{0.85 \times 30}}\right) \\
& =4.169 \times 10^{-5}\left(\text { use } \rho_{\mathrm{min}}\right) \\
& =\rho_{\text {shrinkage }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dx} \\
\mathrm{As}_{\text {need }} & =0.0018 \times 1 \mathrm{~m} \times 0.7 \mathrm{~m} \\
& =1.26 \times 10^{-3} \mathrm{~m}^{2} \\
& =1260 \mathrm{~mm}^{2}
\end{aligned}
$$

## Total reinforcement:

$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1260}{314.2}=4.011$ (use 5 reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=200 \mathrm{~mm}$
useD20-200mm

## b) Negative Moment

$$
\begin{aligned}
\mathrm{Mu} & =1,558.31 \mathrm{kgm} \\
\mathrm{Mn} & =\frac{\mathrm{Mu}}{\phi}=\frac{=1,558.31}{0.9}=1.731 \times 10^{3} \mathrm{kgm} \\
\mathrm{Rn} & =\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=\frac{1.731 \times 10^{3}}{1 \mathrm{~m} \times 0.7^{2}}=3.534 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2} \\
& =0.03534 \mathrm{~N} / \mathrm{mm}^{2} \\
& =\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 \mathrm{Rn}}{0.85 \times f c}}\right) \\
\rho_{\text {perlu }} \quad & \\
& =\frac{0.85 \times 50}{350}\left(1-\sqrt{1-\frac{2 \times 0.03534}{0.85 \times 30}}\right) \\
& =1.016 \times 10^{-3}\left(\text { use } \rho_{\text {shrinkage }}\right)
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{As}_{\text {need }} \quad & =\rho_{\text {shrinkage }} \times 1 \mathrm{mx} \mathrm{dx} \\
& =0.0018 \times 1 \mathrm{~m} \mathrm{x}^{0.7 \mathrm{~m}} \\
& =1.26 \times 10^{-3} \mathrm{~m}^{2} \\
& =1260 \mathrm{~mm}^{2}
\end{aligned}
$$

Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1260}{314.2}=4.011$ (use 5 reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=200 \mathrm{~mm}$
useD20-200mm

## 4. 9.3.2 Reinforcement for $Y$ direction

a) Positive Moment
$\begin{array}{ll}\mathrm{Mu} & =64.35 \mathrm{kgm} \\ \mathrm{Mn} & =\frac{\mathrm{Mu}}{\phi}=\frac{64.35}{0.9}=71.5 \mathrm{kgm}\end{array}$
$\mathrm{Rn} \quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{71.5}{1 \mathrm{~m} \times 0.66^{2}}=164.141 \mathrm{~kg} / \mathrm{m}^{2}$

$$
=0.0164 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\rho_{\text {perlu }} \quad=\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
\begin{aligned}
& =\frac{0.85 \times 50}{350}\left(1-\sqrt{1-\frac{2 \times 0.0164}{0.85 \times 30}}\right) \\
& =4.664 \times 10^{-5}\left(\text { use } \rho_{\text {min }}\right) \\
\mathrm{As}_{\text {need }} \quad & =\rho_{\text {shrinkaget }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dy} \\
& =0.0018 \times 1 \mathrm{~m} \times 0.66 \mathrm{~m} \\
& =1.12 \times 10^{-3} \mathrm{~m}^{2} \\
& =1120 \mathrm{~mm}^{2}
\end{aligned}
$$

Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1120}{314.2}=3.782$ (use 4 reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=250 \mathrm{~mm}$
useD20-250mm
b) Negative Moment
$\mathrm{Mu} \quad=1,558.31 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{=1,558.31}{0.9}=1.731 \times 10^{3} \mathrm{kgm}$
$\mathrm{Rn} \quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{1.731 \times 10^{3}}{1 \mathrm{~m} \times 0.66^{2}}=3.975 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2}$

$$
=0.03975 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{190.98}{0.9}=201.089 \mathrm{kgm}$
$\mathrm{Rn} \quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=201.089=410.385 \mathrm{~kg} / \mathrm{m}^{2}$
$=0.041 \mathrm{~N} / \mathrm{mm}^{2}$
$\rho_{\text {perlu }} \quad=\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
\begin{aligned}
& =\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.041}{0.85 \times 30}}\right) \\
& =1.174 \times 10^{-4}\left(\text { use } \rho_{\text {shrinkage }}\right) \\
\text { As }_{\text {need }} \quad & =\rho_{\text {shrinkage }} \times 1 \mathrm{~m} \mathrm{x} \mathrm{dx} \\
& =0.0018 \times 1 \mathrm{~m} \mathrm{x} 0.7 \mathrm{~m} \\
& =1.26 \times 10^{-3} \mathrm{~m}^{2} \\
& =1260 \mathrm{~mm}^{2}
\end{aligned}
$$

## Total reinforcement:

$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1260}{314.2}=4.011$ (use 5reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=200 \mathrm{~mm}$
useD20-200mm

## b) Negative Moment

Mu

$$
=3,544.55 \mathrm{kgm}
$$

Mn

$$
=\frac{\mathrm{Mu}}{\phi}=\frac{=3,544.55}{0.9}=3.938 \times 10^{3} \mathrm{kgm}
$$

Rn

$$
=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dx}^{2}}=\frac{3.938 \times 10^{3}}{1 \mathrm{~m} \times 0.7^{2}}=8.038 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2}
$$

$$
=0.08038 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\rho_{\text {perlu }} \quad=\frac{0.85 \times f \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
\begin{aligned}
& =\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.08038}{0.85 \times 30}}\right) \\
& =2.989 \times 10^{-3}\left(\text { use } \rho_{\text {min }}\right) \\
\mathrm{As}_{\text {need }} & =\rho_{\text {shrinkage }} \times 1 \mathrm{mxdx} \\
& =0.0018 \times 1 \mathrm{~m} \mathrm{x} 0.7 \mathrm{~m} \\
& =1.26 \times 10^{-3} \mathrm{~m}^{2} \\
& =1260 \mathrm{~mm}^{2}
\end{aligned}
$$

Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1260}{314.2}=4.011$ (use 5reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=200 \mathrm{~mm}$
useD20-200mm

## 4. 9.3.2 Reinforcement for $Y$ direction

a) Positive Moment
$\mathrm{Mu} \quad=180.98 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{190.98}{0.9}=201.089 \mathrm{kgm}$
$\mathrm{Rn} \quad=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=201.089=461.637 \mathrm{~kg} / \mathrm{m}^{2}$

$$
=0.0461 \mathrm{~N} / \mathrm{mm}^{2}
$$

$\rho_{\text {perlu }} \quad=\frac{0.85 \times f \mathrm{fc}}{\text { fy }}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
=\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.0461}{0.85 \times 30}}\right)
$$

$$
\left.=1.313 \times 10^{-4} \text { (use } \rho_{\text {shrinakge }}\right)
$$

$\mathrm{As}_{\text {need }} \quad=\rho_{\text {shrinkage }} \times 1 \mathrm{mxdy}$
$=0.0018 \times 1 \mathrm{mx} 0.66 \mathrm{~m}$
$=1.2 \times 10^{3} \mathrm{~m}^{2}$
$=1200 \mathrm{~mm}^{2}$
Total reinforcement:
$\mathrm{n} \quad=\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1200}{314.2}=3.782$ (use 4reinf.)
$\mathrm{s} \quad=\frac{1 \mathrm{~m}}{\mathrm{n}}=250 \mathrm{~mm}$
useD20-250mm
b) Negative Moment
$\mathrm{Mu} \quad=3,544.55 \mathrm{kgm}$
$\mathrm{Mn} \quad=\frac{\mathrm{Mu}}{\phi}=\frac{=3,544.55}{0.9}=3.938 \times 10^{3} \mathrm{kgm}$
Rn
$=\frac{\mathrm{Mn}}{1 \mathrm{~m} \times \mathrm{dy}^{2}}=\frac{3.938 \times 10^{3}}{1 \mathrm{~m} \times 0.66^{2}}=9.041 \times 10^{3} \mathrm{~kg} / \mathrm{m}^{2}$
$=0.09041 \mathrm{~N} / \mathrm{mm}^{2}$
$\rho_{\text {perlu }} \quad=\frac{0.85 \times \mathrm{fc}}{\mathrm{fy}}\left(1-\sqrt{1-\frac{2 R n}{0.85 \times f c}}\right)$

$$
=\frac{0.85 \times 30}{350}\left(1-\sqrt{1-\frac{2 \times 0.09041}{0.85 \times 30}}\right)
$$

$$
=2.989 \times 10^{-3}\left(\text { use } \rho_{\text {shrinkage }}\right)
$$

As $_{\text {need }} \quad=\rho_{\text {shrinkage }} \times 1 \mathrm{~m} \times$ dy

$$
=0.0018 \times 1 \mathrm{~m} \times 0.66 \mathrm{~m}
$$

$$
=1.2 \times 10^{3} \mathrm{~m}^{2}
$$

$$
=1200 \mathrm{~mm}^{2}
$$

## Total reinforcement:

$\begin{array}{ll}\mathrm{n} & =\frac{\mathrm{As}_{\text {need }}}{\mathrm{As}_{\phi}}=\frac{1200}{314.2}=3.782 \text { (use } 4 \text { reinf.) } \\ \mathrm{s} & =\frac{1 \mathrm{~m}}{\mathrm{n}}=250 \mathrm{~mm}\end{array}$
use D20-250mm

## CHAPTER 7 <br> CONCLUSION

### 7.1. Conclusion

Conclusion from the analysis and calculating of this final project are:

1. Precast prestress slab on ground

- Dimension : $3 \mathrm{~m} \times 6 \mathrm{~m}$
- Thickness $: 25 \mathrm{~cm}$
- Reinforcement : tendon, mild-steel reinf.
- Tendon : Freyssinet, Type F, 5 strands
- Mild-reinforcement : D12-250mm

2. Machine foundation

- Dimension $\quad: 12 \mathrm{~m} \times 24 \mathrm{~m}$
- Thickness : 1m
- Reinforcement : D25-250mm

3. Interior column pilecap

- Dimension $: 2 \mathrm{~m} \times 2 \mathrm{~m}$
- Thickness $: 80 \mathrm{~cm}$
- Reinforcement : D20-200mm

4. Exterior column pilecap

- Dimension $: 3 \mathrm{~m} \times 3 \mathrm{~m}$
- Thickness $: 80 \mathrm{~cm}$
- Reinforcement : D20-200mm

### 7.2. $\quad$ Suggestion

Furthermore learning of upper structure will be needed to analyze the exact real condition, hence, the calculating of foundation could be more detailed.

## WRITER'S BIODATA

The writer was born in Jakarta, December $17^{\text {th }} 1993$. She is the second daughter with an older brother and a twin. She studied in Mardi Yuana Elementary and Junior High School then continued in SMAN 1 Serang in 2009 and graduated in 2011. She attended University in Surabaya, Institut Teknologi Sepuluh Nopember, and took Bachelor Degree Program in Civil Engineering.

Writer was also active in some organizations and community in campus and out of the campus. For example, a social organization, Civillage, that build a library in a remote area as material and human resources engineer, took a role in Christian community in university, and joint some volunteering works in International Church. She had also joined some internship in WIKA Building in 2013 and PT. Teamworx Indonesia as structural engineer in 2014.

The writer is really interested in structural engineering and property business. She hope with this final project she can reach her dream to get a Bachelor Degree title and continue her study in Master Degree.
