ABSTRAK

Jika kita melihat aturan IMO tentang mengendalikan emisi lingkungan yang disebabkan oleh mesin utama kapal, pada tahun 2020, semua kapal yang berlayar di area Internasional, harus membatasi kandungan sulfur pada gas buang sebesar 0,5% atau kurang. Melihat kurangnya batasan sulfur yang diatur oleh IMO, hampir semua kapal harus mengurangi kandungan sulfur yang terkandung di Exhaustnya. Jadi, alternatif untuk mengurangi kandungan sulfur di gas buang adalah menginstal alat, bernama Scrubber. Prinsip kerja Scrubber adalah membersihkan gas buang dari partikel keras dan menurunkan suhu gas hingga batas tertentu. Kandungan sulfur pada gas buang berkurang karena air pancuran. Dan kemudian, air diproses dan dialirkan kembali ke laut. Jadi, kapal berbendera Indonesia yang berlayar di area Internasional harus siap memasang scrubber untuk berlayar sampai tujuan yang kami tuju. Karena harga Scrubber terlalu mahal dan peralatan ini relatif baru, kita perlu mempersiapkan scrubber dan dianggap mungkin untuk efektivitas lingkungan laut. Harga pemasangan Scrubber Hybrid loop ini sekitar 1,282 Juta Euro dan diprediksi perbedaannya 57% lebih murah dari perkiraan Berqvist et al yang mencapai 3 juta Euro. Perbedaan estimasi biaya per tahun dalam *Open Loop* dan *Closed loop* berbeda sekitar 1,073 Miliar Rupiah atau 1061,1% per tahun. Sedangkan pada *Operational Expenditure*, *Open Loop* dan *Closed Loop* memiliki nilai perbedaan yang sama, namun dengan persentase 100,23% per tahun.

Kata Kunci: Scrubber, kandungan sulfur, gas buang, estimasi biaya, kapal

ABSTRACT

If we see IMO rules about controlling environmental emissions caused by ship's main engine, by 2020, all the ship that sailed in International zone, must limit the sulphur content at the exhaust gas at 0.5% or less. See the lack of sulphur limitation referred by IMO, almost all ships must decrease the sulphur content that contain at its exhaust. So, the alternative for decreasing sulphur content at the exhaust gas is installing the tool, named Scrubber. The work principal of Scrubber is to clean the exhaust gas from hard particles and decrease gas temperature until at certain limit. The sulphur content at exhaust gas is decreased because of the shower water. And then, the water is processed and flowed back to the sea. So, the ship with Indonesian flag that sail at International area must be prepared for attaching a scrubber for sailing until the destination that we demand. Because Scrubber price is too expensive and this equipment is relatively new, we need to prepare the scrubber and considered as possible for effectivity of marine environment. The cost estimated for Scrubber attachment is about 1,282 Million Euro and predicted difference is about 57% cheaper than Berqvist et al Estimation which is 3 Million Euro. Cost Estimation per year between Open Loop and Closed Loop is about 1,073 Billion Rupiah or 1061,1% per year. While at Operational Expenditure, Open Loop and Closed Loop have a same difference, but in percentage is 100,23% per year.

Keyword: Scrubber, sulphur content, exhaust gas, cost estimation, ship

PREFACE

Thanks to Allah SWT that gives me chance to make this thesis named “SCRUBBER APPLICATION FOR MT SENIPAH TO MEET THE REGULATIONS IN 2020” with an optimal result. This thesis is proposed for a graduation requirement for Bachelor Engineering at Double Degree Marine Engineering program at Institut Teknologi Sepuluh Nopember Surabaya. Writer also think this thesis also have some mistake so this needs critics and suggestions, so this thesis would be useful later on.

In the way of working this thesis, and process to get Bachelor Engineering achievement can be achieved by help from people and another side. So, the writer say thank you for these people below,

1. Writer Family, Ms. Hermin Fariyana, Mr. Edy Widarto, Auviera Pascafiwi that always support and bless this writer
2. Mr. Gandung and Mrs. Linda that give me some required data for this thesis
3. Mr. Beny Cahyono, S.T., M.T., Ph. D, as Head of Marine Engineering Department
4. Mr. Ir. Dwi Priyanta, M.SE as Lecturer that always bless and motivate this writer.
5. Mr. Dr. I Made Ariana, S.T, M.T. that supervise my thesis Proposal
6. Mr. Taufik Fajar Nugroho, S.T, M.Sc and Mr. Ir. Hari Prastowo, M.Sc, as supervisor and supervise this thesis
7. Aghnia, Rian, Endah, Rifqi, Marfen, Rendy that supports this writer
8. All friends on VOYAGE'16 that always supports me while working on this thesis, even SALVAGE '15 etc.
9. And everyone that I cannot mention one by one

Surabaya, 30 May 2020

Oscar Alfinza Fadiwi

CHAPTER 1 INTRODUCTION

1.1. Background

In Indonesia, there are many ships that sails to international areas to export commodities or import commodities. Based on IMO Regulations, the ship that sails at International areas start at 1 January 2020, must limit the sulphur content at 0,5 % at local SECA (Sulphur Emission Control Areas) and 0,1% (SECA Areas) (Makkonen, 2017). If we see the lack of emission that refered to IMO rules, almost all ships in Indonesia must attach the Scrubber into their ships. It will be predicted about 3000 ships, new built or existing one will chose Scrubber attachment to comply the rules of IMO 2020. Based on DNV GL, the ship that install scrubber until May 2019 reached 3266 units. And for the tanker itself have 470 ships including MT Senipah.

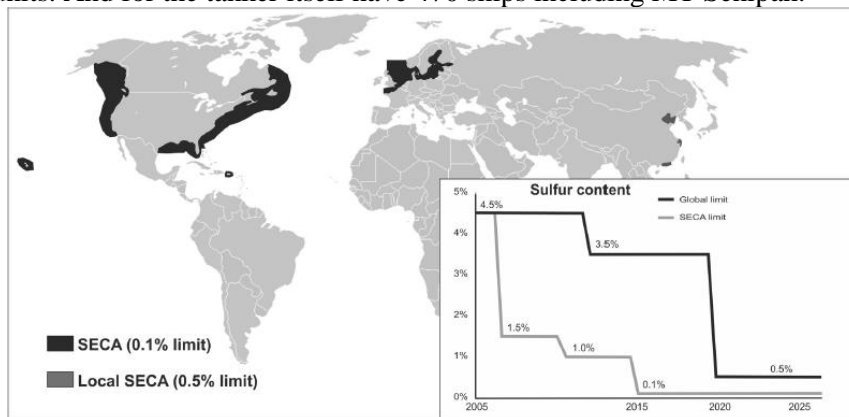

Figure 1.1 The geographical and regulatory aspects (sulfur content in bunker fuel) of Sulfur Emission Control Areas (SECAs) [4]

Based on the regulation, the sulphur content that will be permitted in marine fuels is 3,5% while ships operating at ECA (Emission Control Areas) at 1%(10000 ppm), global limitations will decrease the sulphur content at 0,5%(5000 ppm) at 2020 and at Emission Control areas is decreased from 1% to 0,1% (1000 ppm) since 2015.

Table 1.1 Outside and Inside ECA Limit of SO_x and particulate matter [11]

| Outside an ECA established to limit Sox and particulate matter emissions | Inside an ECA established to limit Sox and particulate matter emissions |
|--|---|
| 4.50% m/m prior to 1 January 2012 | 1.50 % m/m prior to 1 July 2010 |
| 3.50% m/m on and after 1 January 2012 | 1.00% m/m on and after 1 July 2010 |
| 0.50% m/m on and after 1 January 2020 | 0.10% m/m and after 1 January 2015 |

Based on MT Senipah's data, the first data will be

Table 1.2 MT Senipah's first data

| Parameter | Results |
|-------------------------------------|---------------------------|
| Fuel Oil Consumption (100%) | 181,31 g/kWh (+5% margin) |
| Engine Power | 4440 kW |
| Engine Speed | 173 rpm |
| Exhaust Gas temperature (110% load) | 418 ^o C |
| Fuel Oil Sulphur Content | 0,23% m/m |

For the equivalence with Sulphur Content itself with Emission ratio, can be seen on data below:

Table 1.3 Sulphur Content and Ratio Emission Equivalence [12]

| Fuel Oil Sulphur Content (%m/m) | Emission Ratio (SO ₂ (ppm)/CO ₂ (% v/v)) |
|---------------------------------|--|
| 4,50 | 195,0 |
| 3,50 | 151,7 |
| 1,50 | 65,0 |
| 1,00 | 43,3 |
| 0,50 | 21,7 |
| 0,10 | 4,3 |

Based for the equivalence predictions, the fuel of MT Senipah have an emission ratio about 9,959 SO₂(ppm)/CO₂(%v/v)

For the estimation cost for Scrubber Application, there are several types of scrubbers as shown on data below:

Table 1.4 Cost Estimation of Scrubber Application [14]

| Types of Scrubbers | Retrofit cost(20 MW Cargo Vessel) | New Buid cost (20 MW Cargo Vessel) |
|--------------------|-----------------------------------|------------------------------------|
| Open System | 2,4 Million Euro | 2,1 Million Euro |
| Closed System | 2,4 Million Euro | 1,9 Million Euro |
| Hybrid System | 3,0 Million Euro | 2,6 Million Euro |

Based on the table, the retrofit cost may be expensive than new build cost because we add an addition systems to the ship.

For the fuel oil price prediction can be arise from 57% to 85% from some studies

Table 1.5 Comparison price of Fuel Oil by some Studies [14]

| Study | Forecasted price of MGO/MDO with 0.1 % sulphur content year 2015 per tonne | Forecasted price increase between HFO with 1.5% sulphur content and MGO/MDO with 0.1 % sulphur content |
|--------------|--|--|
| COMPASS | 883 USD | 65% |
| ISL | Low Cost Scenario: 850 USD High Cost Scenario: 1300 USD | 70-86% 57-75% |
| Kalli et al. | 633-673 USD | 73-85% |

And the prediction of LNG fuel mentioned by Santoso, 2014 is 21 USD /MMBTU and assumption with using 65% LNG and 35% Diesel. Sometimes LNG and Low Sulphur Diesel oil is available only in several areas, but Heavy Fuel Oil is cheap and available on many ports. So, retrofiting Scrubber is an option to comply Marpol IMO Regulation Annex 6 to keep allowance to use HFO.

1.2. Problem Statement

From the description above, then we can determine the main issues that will be discussed more as mentioned below:

1. How is the effect of Scrubber Application for MT Senipah?
2. How to determining the result after Scruber Application?
3. How to calculate the system before Scrubber Application?
4. How much the price estimation for Scrubber Application?

1.3. Research Objectives

Based on problems mentioned above, the goals of this research are:

1. Provide the effect of Scrubber Application for MT Senipah.
2. Provide the result after Scrubber Application.
3. Calculating the Scrubber system to Applied in MT Senipah
4. Estimating the cost for Scrubber Application

1.4. Scope of Study/Research Limitation

This final project will be focused and organized with limitations on problem, which are:

1. Analysis of Sulphur content after Scrubber attachment.
2. Analysis of calculation at Scrubber System.
3. This research will be done on MMS – PT. Pertamina Shipping International Project with SEPCO
4. Estimating cost for Scrubber Application
5. Assuming if this ship using Hybrid loop system

1.5. Research Benefits

This final project is expected to give benefits for various parties. The benefits that can be obtained are:

1. Sulphur content can comply to the IMO Regulations in 2020.
2. Knowing the effect after Scrubber Application.
3. Estimating costs for scrubber application

1.6. Pros and Cons of Scrubber Application

There are several pros about Scrubber Installation, such as:

1. The Sulphur content (SO_x) can comply to regulations in Marpol regulation in 2020
2. Can continuously run with HFO which is cheaper than Compliant fuel.

Beside of that, there are several consequences of Scrubber Application, such as:

1. Redesign the system of the aft side of the ship
2. Off duty due to scrubber system installation (approx. 18 days)
3. Class approval
4. Engine Room space may be limited
5. Weight addition of required systems
6. Calculating the existing electrical system and make sure the generator can supply all electricals including scrubber system (e.g monitoring systems and water pumps)

CHAPTER 2 LITERATURE STUDY

2.1 Scrubber

Scrubber is a system that used to remove harmful materials from exhaust gases that can give an effect to the environment. The basic of the Scrubber system is spraying the exhaust gas with the seawater to capture the carbon particles and SO_x gas content that formed into Sulphuric Acid (H_2SO_4) when the gas is on contact with water and reduce PM (Particulate Matter). Before the wash water is discharge into the sea, the wash water itself is filtered from sludge that contains carbon particles and other particulate fuel impurities. Depending on onboard treatment and discharge pipe configuration it is likely that the wash water will be in the form of a warm acidic jet. The immediate effects of the acidic discharge are mitigated due to rapid pH recovery back to ambient levels in the vicinity of the discharge nozzle. The scrubber itself has 2 categories of Scrubbers, which is Wet Scrubbers (Open Loop, Closed Loop, Hybrid) and Dry Scrubbers.

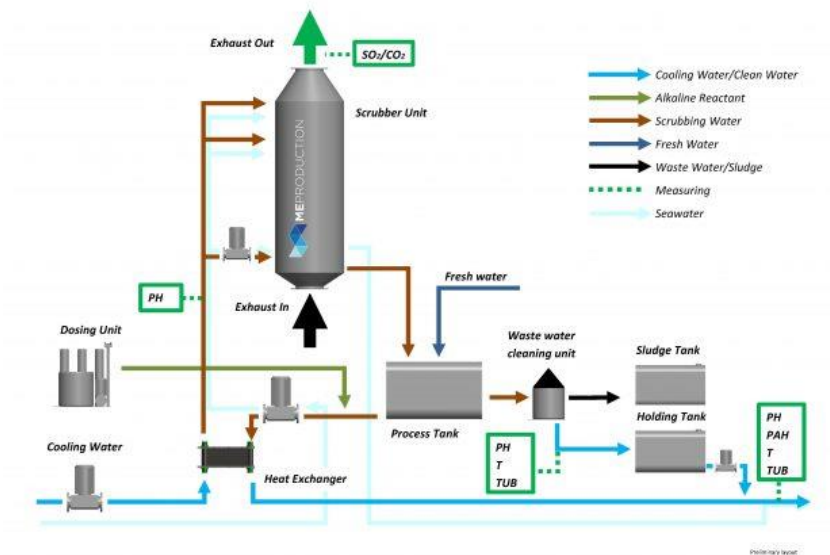

Figure 2.1 Scrubber System [15]

2.2 Wet Scrubber

Wet Scrubbing is an Original type of Scrubbing Systems. In a wet Scrubber System, the gas is going through in an exhaust pipe and then, seawater is actively sprayed. Water is used when the gas needs dust and particulate matter is removed. Basically, other chemicals are added that react with certain airborne contaminants. Since this process adds so much vapor to the exhaust, if the gas is vented, it typically looks like white smoke.

The sprayed liquid is collected in the Sludge Tank. This liquid is funneled away from the spraying chamber and collected for disposal. Since the liquid contains a wide range of potentially harmful materials, it cannot be reused or simply poured down the drain. Wet Scrubber also have a several components, such as a scrubber unit, a treatment plant, a residue handling facility for sludge, and a scrubber control and its monitoring system.

Figure 2.2 Wet Scrubber [3]

2.3 Dry Scrubber

Dry Scrubber or Dry Scrubbing system is a system that remove the pollution from harmful gases. Dry Scrubbers are used to remove harmful gases and particulate matter from Industrial exhaust gas, even to reduce exhaust gases that cause acidic rain. These scrubbers are applied on Asphalt Processing, Pharamanauticals, and Oil and Gas. And the works is same as Wet Scrubbers but it uses dry reagents as a spray on this system. There are three steps to neutralize the gas, such as gas cooling, reagent injection, and filtering. First, gas cooling can be done to prepare exhaust gases. In gas cooling, the exhaust gas is cooled to remove the pollutant easier to remove pollutants and other toxins at the gas, then the dry reagents can be injected into the system. The component of dry reagent is Sodium Bicarbonate because of the neutralizing capabilities. And the system can be placed before gas exhaust economizer (EGE) or by using Selective Catalytic Reduction (SCR) which is require an exhaust gas above 350°C to enable the catalyst to operate corretly. This system also uses Caustic Lime ($\text{Ca}(\text{OH})_2$) as granules and react with Sulphur Dioxide (SO_2) which form calcium Sulphate

Then, Calcium Sulphate is Air-oxidized to form Gypsum (calcium sulphate dehydrate)

And, the reaction of caustic lime with sulphur trioxide is:

Figure 2.3 Dry Scrubber [17]

2.4 Open Loop Scrubber System

In Open Loop Scrubber System, it uses seawater for purification, and then the water is pumped back to the sea. This system is efficient in sea areas with high salt levels and also needs sea environments with high salinity and alkalinity to discharge the wash water to neutralize. The systems located near chimney of the ship and also needs space for water monitoring system and pumps, so it takes a lot of space, which can reduce the cargo capacity. Sea water is supplied by pump. CO₂ dissolves into sea water forms carbonic acid, bicarbonate, or carbonate ions. Depends on pH. The positive ions can be Calcium (Ca²⁺) or sodium (Na⁺), the example of salts in this case is sodium carbonate. When the ions reacts with an acid, CO₂ is released with the following formula.

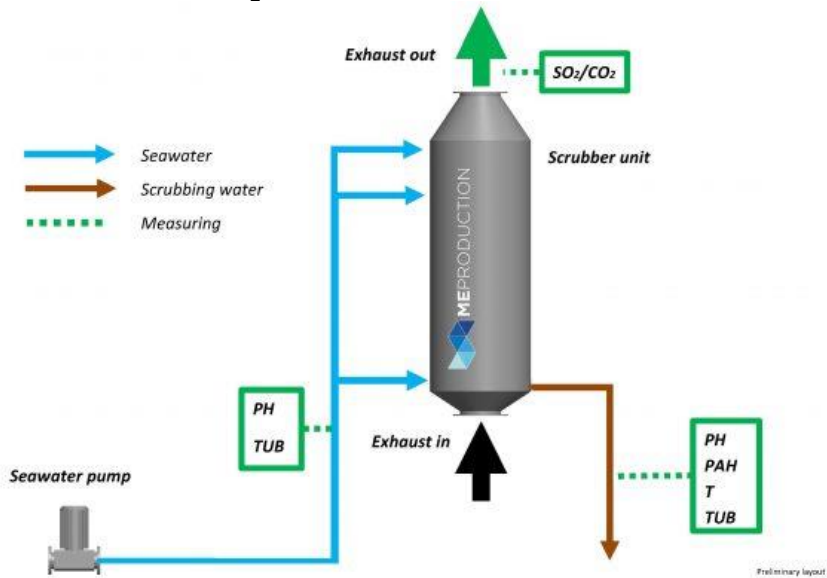

Figure 2.4 Open Loop Scrubber System [18]

2.5 Closed Loop Scrubber System

Closed Loop Scrubber system use freshwater and seawater to clean the exhaust gas. The filtered waste is generated and collected in special tanks. And then, the waste is unloaded in specialized port facilities that can handle the scrubber waste. In some ports, vessels will charged per amounts of scrubber waste discharged. This system requires more equipment than open loop system because this system requires extra tanks for chemicals (caustic soda) and waste. The water is circulated through the system to keep the scrubbing process, in addition possibility of water discharge is little or no water discharge. Most of the wash water will be processed and this system uses a chemical which is sodium hydroxide or caustic soda. And some manufacturers claim that this system is more efficient because this system requires half or less of the wash water at the same scrubbing efficiency because of the higher levels of alkalinity levels can be controlled using caustic soda injection process. For the fresh water scrubbers, SO_2 Combines with a salt and do not react with the natural bicarbonate of seawater. And no release of CO_2 . The reaction formula for closed loop can be seen on the formula below:

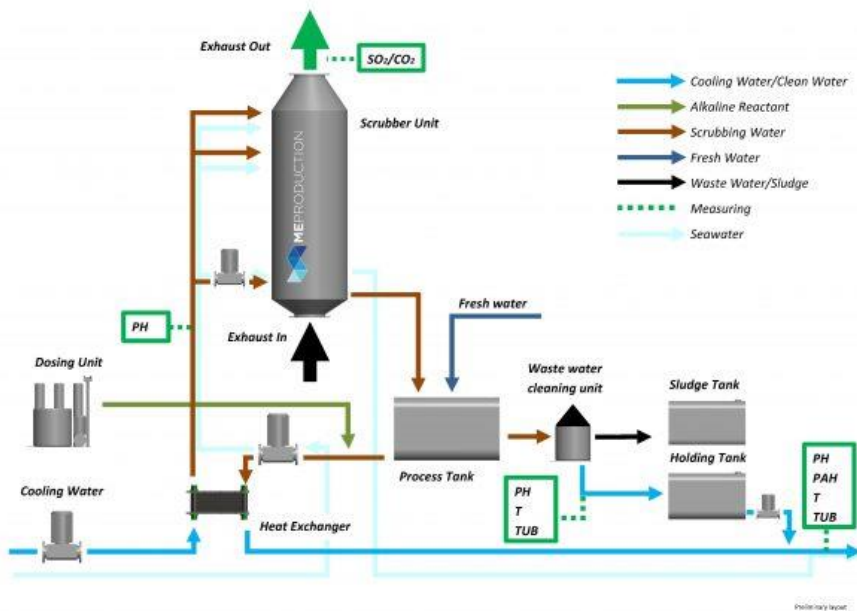

Figure 2.5 Closed Loop Scrubber System [16]

2.6 Hybrid Loop Scrubber System

Hybrid Loop Scrubber System is a combination of open loop scrubber system and closed loop scrubber system. This system enables closed loop operation if needed. Sometimes, at sea the system can be made to open loop system that using only seawater. Hybrid loop Scrubber System can combine many advantages of scrubber system, such as avoiding of purchasing and handling caustic soda in open loop system and have the same efficiency when there is zero discharge zone in Closed loop system.

Figure 2.6 Hybrid Loop Scrubber System [8]

2.7 Wash Water Requirements

Based on Ülpre (2014), the wash water requirements are comply with the MEPC 59/24/Add.1 Annex 9 regulation, which is:

- I. The discharge wash water have a required pH at minimum 6,5 measured at ship's overboard discharge via monitoring systems. Except during manouvering and transit, the maximum difference between inlet and outlet is 2 pH units is allowed measured at the ship inlet and overboard discharge via monitoring systems.
- II. After scrubber installation, the discharged wash water should be measured externally from the ship, and the discharge pH at the ship's monitoring point will be recorded when the plume at 4 m from the discharge point equals or is above 6,5

Figure 2.7 Schematic of a typical wet open loop exhaust gas scrubber setup [9]

2.8 The Effect if The Sulphur Content is Too High

Based on IMO regulation 14 that regulates Sulphur Oxides (SO_x) and Particulate matter, SO_x and another particulate matter is a component that apply on all fuel oils. SO_x is generated by combustion of fuel oil due to sulphur content that will not be removed from fossil oils. If the sulphur content is too high (SO_x) have many effects, e.g Acidic rain that will decrease the water pH, plant damage (that happened at 0,5 ppm of sulphur) and so on.

2.9 Heat Exchanger

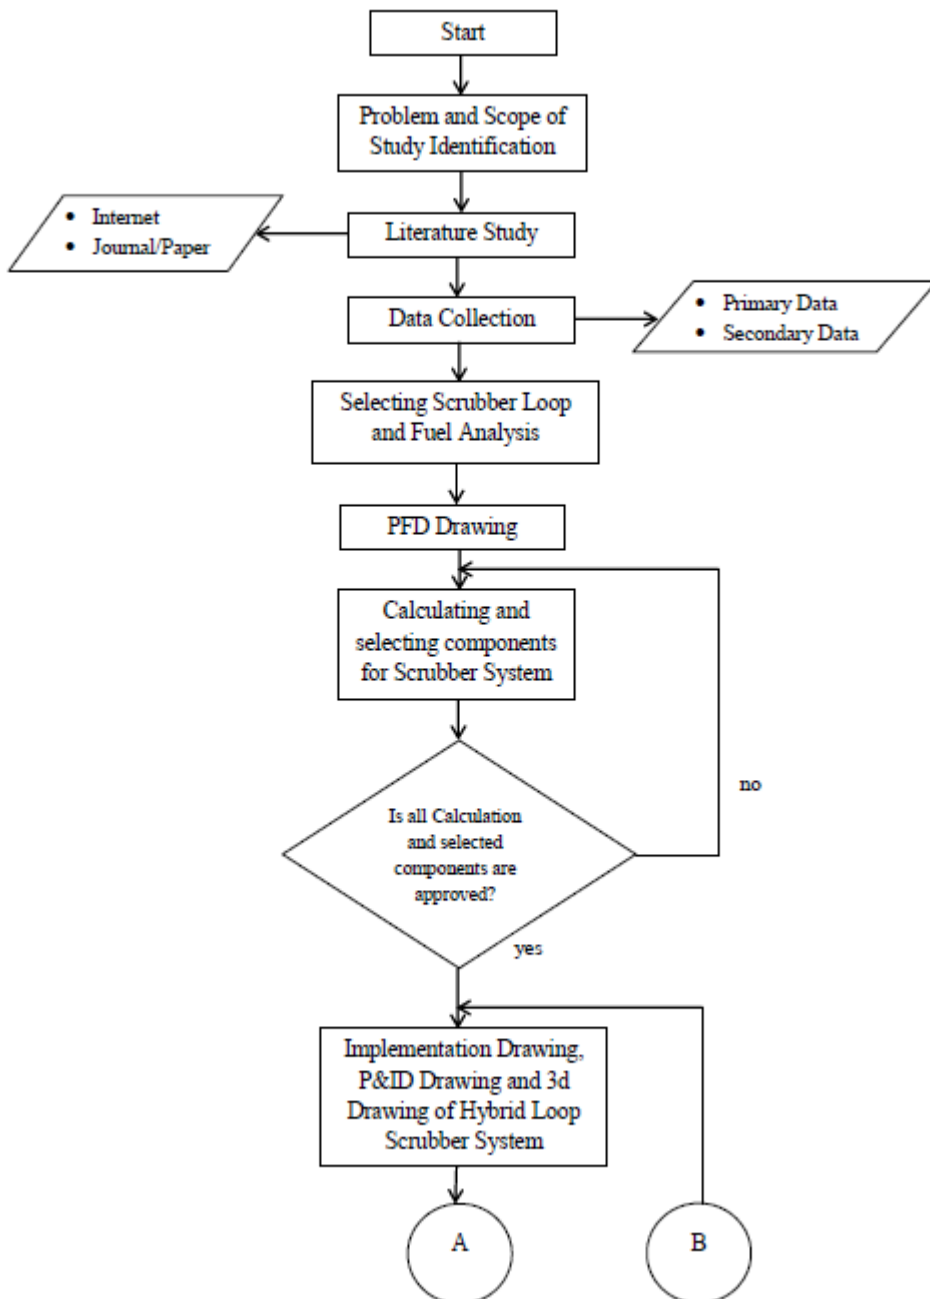

Heat Exchanger is a heat transfer device that is used to transfer the heat one fluid to another fluid or more fluid at different temperatures. This system consists of heat exchanging elements such as a core or matrix contains heat transfer surface, and fluid distribution elements, such as headers or tanks, inlet and outlet nozzles or pipes, etc. There are several types of Heat Exchangers such as tubular heat exchanger, plate heat exchangers, etc. This system is used on automobile radiators, air conditioning, and scrubber system (closed-loop or hybrid loop) in this case.

Figure 2.8 Heat Exchanger [20]

CHAPTER 3 METHODOLOGY

3.1 Research Scheme

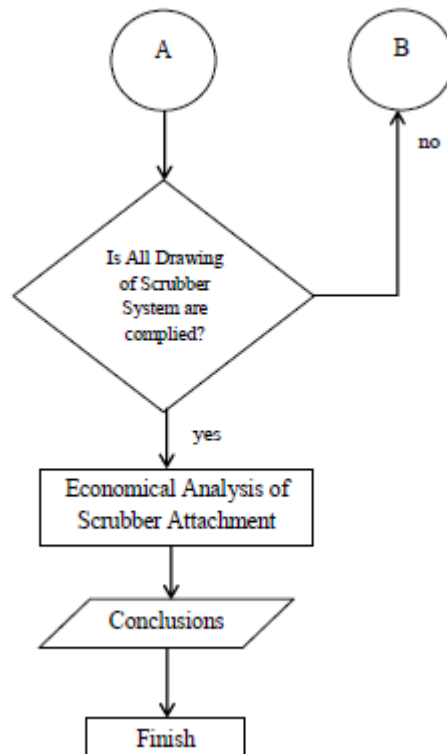

Figure 3.1 Research Scheme

3.2. Methodology Identification

The methodology identification is an explanation based on analysis method that will be conducted in order to encounter the problem of this research. The problem analysis in this research is Sulphur content that need to be comply in 2020, which is 0,1% for SECA areas, and the cost when the Scrubber is applied, and Emission content from the ship.

3.3. Research Steps

The research will be based on a various steps to achieve its result and goals. Hereby are the further explanation of methodological flow from the beginning of the process, collecting data, until the final process resulting the objectives of this research:

3.3.1. Problem and Scope of Study Identification

In the initial step of this research, the researcher will learn about the regulations of IMO, the effect of sulphur content, and . The research process will be based on literature, observation, and discussion with supervisor. From the initial identification, then the parameter, data analysis, research method, and limitation of this research will be determined.

3.3.2. Literature Study

The next step of this research is study literature. The study shall be related to the existing problems and in accordance with the purpose of the study. The aim of literature study is to have a better understanding for the researcher about the supporting information and problem related to this research. Literature-related issues can be used as a reference to understand the problem.

3.3.3. Data Collection

At this stage, the researcher do an analysis of Scrubber Application on MT Senipah based on following data that provided from internet and the ship owner, PT Pertamina Shipping .

3.3.4. Selecting Scrubber Loop and Fuel Analysis

At this stage, the researcher will choose the Scrubber Loop of MT Senipah, in this case the researcher will use Hybrid Loop and analyse the difference of fuel consumption per trip

3.3.5. PFD Drawing

In this stage, the researcher will draw the PFD (Process Flow Diagram) comply to the scrubber system that the researcher use to make the flow of water in the scrubber system.

3.3.6. Calculating and Selecting Components for Scrubber System

After that, the researcher will calculate the required components for scrubber system, calculating load factors for each system and comparing between the existing one and new one.

3.3.7. Implementation Drawing, P&ID Drawing, and 3d Drawing

After calculating all components for Scrubber system, the researcher will continue to draw the Implementation Drawing, P&ID Drawing, and 3d Drawing of the system based on Engine Room Layout from MT Senipah. And possibility to draw Heat and Balance diagram based on P&ID Diagram

3.3.8. Economical Analysis of Scrubber Attachment

After Selecting the components and make the allocation on the drawing, the researcher will calculate the cost of all components that the ship uses, including Installation costs, indirect costs, Capital Expenditure, and Operational Expenditure for additional items on this ship.

3.3.9. Conclusions

This is the final stage of this research when the researcher will conclude the result of this research.

CHAPTER 4

RESEARCH AND ANALYSIS

4.1 Ship's Main Data

Figure 4.1 MT Senipah [21]

The main data of the ship is based on following table below:

Table 4.1 Main Data of MT Senipah

| | |
|---------------|--|
| Ship Name | MT Senipah |
| Ship Owner | PT Pertamina Persero |
| Manager | PT Pertamina Persero – Shipping Department |
| Vessel Type | Product Oil Tanker |
| Flag State | Indonesia |
| Class | DNV |
| Year of Built | 2014 |
| Length | 180 m |
| Draught | 9,204 m |
| Breadth | 30,53 m |
| Deadweight | 29754 tons |

4.2 Why Hybrid Loop?

Hybrid Loop Scrubber system is a combination of Open Loop and Closed Loop system, so the ship can choose Open Loop or Closed Loop based on the sailing route. This system also use remote controlled equipment to switch between Open Loop and Closed loop. Even this type can help ships to sail over zero discharge areas without compliance based on Marpol Annex VI.

4.3 Fuel Analysis

Taken from Vesselfinder.com about the trips of MT Senipah, the ship sails from Wayame – Cilacap – Gresik – Cilacap – Tanjung Priok (based on the latest voyage). Voyage range is 2859,079 Nautical Miles with a duration of 10 days. Based on a trip on this ship, shown the data of fuel consumption below

Table 4.2 Fuel Consumption of all engines

| Parameter | HFO Combined (t) | MDO Combined (t) |
|------------------------|------------------|------------------|
| Main Engine | 432,682 | 432,682 |
| Auxiliary Engine (all) | 271,696 | 271,696 |
| Boiler | 156,832 | 149,320 |

Based on the fuel data, the density of fuel in kg/l, are 0,89 (MDO, Exxon Mobil), 1,01 (HFO, powerplants.man-es.com) and 0,85 (HSD, Speight J.G, 2011), the volume of the fuel are based on the data below:

Table 4.3 Fuel Consumption (in Liter)

| Parameter | HFO and HSD (l) | MDO and HSD (l) |
|------------------|-----------------|-----------------|
| Main Engine | 428397,68 | 486159,17 |
| Auxiliary Engine | 319642,47 | 319642,47 |
| Boiler | 155279,62 | 167775,64 |

Based on Pertamina, the fuel price of HSD is IDR 9700, and for MDO is IDR 9550, and for HFO is IDR 7000, the price can be seen on the table below:

Table 4.4 Fuel Price per Trip

| Parameter | HFO and HSD | MDO and HSD |
|------------------------|---------------------|--------------------|
| Fuel Price per trip | Rp7.186.273.084,39 | Rp9.345.609.338,48 |
| Price Difference (IDR) | Rp 2.159.336.254,09 | |
| Price Difference (%) | 30,05% | |

4.4 Data of Main Engine

The main data of Main engine can be seen on the following data:

Table 4.5 Data of Main Engine

| | |
|---|-------------------------|
| Maker / Model | Hyundai MAN B&W 6S42MC7 |
| Power @ 100% MCR (MW) | 6,48 |
| Fuel Consumption @ 100% MCR (mt/day) | 25,92 |
| Flue Gas Temp After Economiser | 220°C |
| Allowable Exhaust Gas Backpressure (mmAq) | 50 |
| Max Flue Gas Flow (kg/hr) | 6798,825 |
| Annual Fuel Consumption Mt/Year | 14824,01 |

Figure 4.2 Main Engine [22]

4.5 Data of Auxiliary Engine

The data of Auxiliary Engine can be seen based on the following data:

Table 4.6 Data of Auxiliary Engine

| | |
|--------------------------------------|------------------------|
| Maker/Model | Anqing Daihatsu 6DK-26 |
| Quantity of AE | 3 |
| Power @100% MCR (MW) | 1,3 |
| Fuel Consumption @ 100% MCR (mt/day) | 6,27 |
| Flue Gas Temp After TC , C | 340 |
| Max Flue Gas Flow (kg/hr) | 2695,385 (per unit) |
| Annual Fuel Consumption Mt/Year | 9308,52 |

Figure 4.3 Auxiliary Engine

4.6 Data of Boiler

Data of Boiler can be seen in following data:

Table 4.7 Data of Boiler

| | |
|--|-----------------------|
| Maker/ Model | Euroboiler THM/V 5000 |
| Max Power (kW) | 4300 |
| Steam @Max Power T/hr | 0,008 |
| Max FO Cons. , Oil- Fired section; kg/hr | 439 |
| Flue Gas Temp; IN/OUT ISO NCR, C | 140/190 |
| Max Flue Gas Flow (kg/hr) / Back pressure (mBar) | 8495/ |
| Annual Fuel Consumption Mt/year | 5373,2 |

4.7 Vessel Load Patterns

Vessel load patterns at testing can be seen at the following data:

Table 4.8 Vessel Operating Patterns

| Parameter | Design Capacity (Max) | Required Design Capacity | At-Sea 1 | In-Port | Maneuvering |
|-------------------------|------------------------------|---------------------------------|-----------------|----------------|--------------------|
| Number of Days per Year | 340 | 340 | 340 | 340 | 340 |
| % of Power of ME | 100 | 85 | 58 | 0 | 85 |
| % of Power of AE1 | 100 | 70 | 70 | 70 | 70 |
| % of Power of AE2 | 100 | 70 | 70 | 70 | 70 |
| % of Power of AE3 | 100 | 70 | 70 | 70 | 70 |
| % of Power of AE4 | - | - | - | - | - |
| % of Power of Boiler | 100 | 75 | 75 | 75 | 50 |

4.8 Gas Rate

To calculate the gas rate, we need to calculate fuel mass and air mass for each engines to know the mass result for the next calculation

4.8.1 Gas Rate of Main Engine

| | | | |
|--------------------|---|-----------------|--------|
| Brand | = | Hyundai MAN B&W | |
| Type | = | 6S42MC7 | |
| Horse Power | = | 6480 | kW |
| Rotation | = | 136 | RPM |
| Number of Cylinder | = | 6 | |
| Bore | = | 420 | mm |
| Stroke | = | 1764 | mm |
| SFOC | = | 0,1869 | kg/kWh |
| Quantity | = | 1 | |

To calculate the flow rate of exhaust gas, we can use the formula below:

$$\dot{m}_E = \dot{m}_f + \dot{m}_a$$

Where:

- \dot{m}_E : Exhaust Gas Mass Flow Rate
- \dot{m}_f : Fuel Mass Flow Rate
- \dot{m}_a : Air Mass Flow Rate

to calculate fuel mass flow rate, we can calculate the rate, so we can get

$$\begin{aligned}\dot{m}_f &= \text{SFOC} \times \text{Power} \\ &= 0,1869 \times 6480 \\ &= 1211,112 \text{ kg/h}\end{aligned}$$

Then, we calculate the Air Mass flow rate based on the formula

$$\dot{m}_a = \eta_v \times \rho_a \times n \times V_s$$

Where:

- η_v : volumetric efficiency (0.8-0.9) (assumed at 0,8)
- ρ_a : Air Fuel Density (1,167 kg/m³)
- n : Speed/2 (136/2 = 68 rpm)
- V_s : Volume of Combustion Chamber

To calculate Volume of Combustion Chamber can be calculated on the following formula

$$V_s = \pi \times \text{bore}^2 \times \text{stroke} \times \text{number of cylinder} / 4$$

Then, we can get

$$\begin{aligned} V_s &= \pi \times 0,42^2 \times 1,764 \times 6 / 4 \\ &= 1,466942 \text{ m}^3 \end{aligned}$$

So, the result of Air mass flow rate is

$$\begin{aligned} \dot{m}_a &= \eta_v \times \rho_a \times n \times V_s \\ &= 0,8 \times 1,167 \times 68 \times 1,466942 \\ &= 93,12854 \text{ kg/min} \\ &= 5587,713 \text{ kg/h} \end{aligned}$$

Then, the total air mass flow rate of Main Engine is

$$\begin{aligned} \dot{m}_E &= \dot{m}_f + \dot{m}_a \\ &= 1211,112 + 5587,713 \\ &= 6798,825 \text{ kg/h} \end{aligned}$$

To calculate into m^3/hr , the result is divided by the density of Air, which is $1,225 \text{ kg}/\text{m}^3$, and the result is

$$\begin{aligned} \text{Flow rate} &= \text{air mass flow rate} / \text{Air density} \\ &= 6798,825 / 1,225 \\ &= 5550,061 \text{ m}^3/\text{h} \end{aligned}$$

4.8.2 Gas Rate of Auxiliary Engine

| | | | |
|--------------------|---|-----------------|--------|
| Brand | = | Anqing Daihatsu | |
| Type | = | 6DK-26 | |
| Horse Power | = | 1300 | kW |
| Rotation | = | 720 | RPM |
| Number of Cylinder | = | 6 | |
| Bore | = | 260 | mm |
| Stroke | = | 380 | mm |
| SFOC | = | 0,195 | kg/kWh |
| Quantity | = | 3 | |

To calculate the flow rate of exhaust gas, we can use the formula below:

$$\dot{m}_E = \dot{m}_f + \dot{m}_a$$

Where:

- \dot{m}_E : Exhaust Gas Mass Flow Rate
- \dot{m}_f : Fuel Mass Flow Rate
- \dot{m}_a : Air Mass Flow Rate

to calculate fuel mass flow rate, we can calculate the rate, so we can get

$$\dot{m}_f = \text{SFOC} \times \text{Power}$$

$$= 0,195 \times 1300$$

$$= 253,5 \text{ kg/h}$$

Then, we calculate the Air Mass flow rate based on the formula

$$\dot{m}_a = \eta_v \times \rho_a \times n \times V_s$$

Where:

- η_v : volumetric efficiency (0.8-0.9) (assumed at 0,8)
- ρ_a : Air Fuel Density (1,167 kg/m³)
- n : Speed/2 (720/2 = 360 rpm)
- V_s : Volume of Combustion Chamber

To calculate Volume of Combustion Chamber can be calculated on the following formula

$$V_s = \pi \times \text{bore}^2 \times \text{stroke} \times \text{number of cylinder} / 4$$

Then, we can get

$$\begin{aligned} V_s &= \pi \times 0,26^2 \times 0,38 \times 6 / 4 \\ &= 0,121101 \text{ m}^3 \end{aligned}$$

So, the result of Air mass flow rate is

$$\begin{aligned} \dot{m}_a &= \eta_v \times \rho_a \times n \times V_s \\ &= 0,8 \times 1,167 \times 360 \times 0,121101 \\ &= 40,70142 \text{ kg/min} \\ &= 2442,085 \text{ kg/h} \end{aligned}$$

Then, the total air mass flow rate of Auxiliary Engine is

$$\begin{aligned} \dot{m}_E &= \dot{m}_f + \dot{m}_a \\ &= 253,5 + 2442,085 \\ &= 2695,585 \text{ kg/h} \end{aligned}$$

To calculate into m^3/hr , the result is divided by the density of Air, which is $1,225 \text{ kg}/\text{m}^3$, and the result is

$$\begin{aligned} \text{Flow rate} &= \text{air mass flow rate} / \text{Air density} \\ &= 2695,585 / 1,225 \\ &= 2200,478 \text{ m}^3/\text{h} \end{aligned}$$

Because, Auxiliary engine in this ship has 3 units, so the total is $6601,433 \text{ m}^3/\text{h}$

4.8.3 Total Gas Flow Rate

Based on the calculation above known as the summary of calculation

- Total Main Engine Gas Flow Rate : 5550,061 m³/h
- Total Auxiliary Engine Gas Flow Rate : 6601,433 m³/h
- Boiler Gas Flow Rate : 6585 m³/h (refer to Scrubber detail measurement data)

So, the total flow rate is:

$$\begin{aligned}
 Q_{\text{Total}} &= Q_{\text{ME}} + Q_{\text{AE}} + Q_{\text{Boiler}} \\
 &= 5550,061 + 6649,188 + 6585 \\
 &= 18736,49 \text{ m}^3
 \end{aligned}$$

4.9 Emission Content

For the data shown is the data for emission content of MT Senipah based on Following data below (assumed as Diesel Engine)

Table 4.9 Emission Content

| Substance | Content |
|------------------|------------------|
| N ₂ | 76% by Volume |
| CO ₂ | 10% by Volume |
| H ₂ O | 3 % by Volume |
| O ₂ | 5 % by Volume |
| SO ₂ | 0.23 % by Volume |
| NO _x | 0.3 % by Volume |
| CO | 0.4 % by Volume |

Based on the data, we calculate the emission rate of the ship.

Known: Gas Rate = 18736,49 m³/h

Item that to be removed:

- SO₂ = 0.23%
- NO = 90% from 0,04% Vol. NO_x
- NO₂ = 10% from 0,04% Vol. NO_x

Sulphur Dioxide (SO₂)

$$V \text{ SO}_2 = 18736,49 \times 0,23\%$$

$$= 43,093 \text{ m}^3/\text{h}$$

$$\rho \text{ SO}_2 = 2,63 \text{ kg/m}^3$$

$$m \text{ SO}_2 = 43,093 \times 2,63$$

$$= 113,33 \text{ kg/h}$$

Nitrogen Monoxide (NO)

$$V \text{ NO} = 18736,49 \times 0,03\% \times 90\%$$

$$= 5,058 \text{ m}^3/\text{h}$$

$$\rho \text{ NO} = 1,34 \text{ kg/m}^3$$

$$m \text{ NO} = 5,058 \times 1,34$$

$$= 6,777 \text{ kg/h}$$

Nitrogen Dioxide (NO₂)

$$V \text{ NO}_2 = 18736,49 \times 0,03\% \times 10\%$$

$$= 0,562 \text{ m}^3/\text{h}$$

$$\rho \text{ NO}_2 = 1450 \text{ kg/m}^3$$

$$m \text{ NO}_2 = 0,562 \times 1450$$

$$= 814,9 \text{ kg/h}$$

4.10 Chemical Reaction and NaOH Addition

Based on the Chemical Reaction, The Chemical reaction of SO_x Scrubber divided into 3 reactions, which is:

Reaction 1. NaOH + SO₂

$$\text{Mass Number: Na} = 23 \quad \text{H} = 1$$

$$\text{S} = 32 \quad \text{O} = 16$$

| | | | | | | | |
|--------------------|--------------------|---|-----------------|---|---------------------------------|---|------------------|
| Reaction | 2NaOH | + | SO ₂ | ↔ | Na ₂ SO ₃ | + | H ₂ O |
| Mass Rate | 141,51 kg/h | | 113,33 kg/h | | 222,97 kg/h | | 31,86 kg/h |
| Mass Number | 40 | | 64 | | 126 | | 18 |
| Mole rate | 3,54 mol/h | | 1,77 mol/h | | 1,77 mol/h | | 1,77 mol/h |

Reaction Results:

- Na_2SO_3 = 222,97 kg/h
- H_2O = 31,86 kg/h

Reaction Remaining:

- NaOH = 28,18 kg/h

| | | | | | |
|--------------------|---------------------------|---|--------------|-------------------|---------------------------|
| Reaction | $2\text{Na}_2\text{SO}_3$ | + | O_2 | \leftrightarrow | $2\text{Na}_2\text{SO}_4$ |
| Mass Rate | 222 kg/h | | 28,18 kg/h | | 250,18 kg/h |
| Mass Number | 126 | | 32 | | 142 |
| Mole Rate | 1,76 mol/h | | 0,88 mol/h | | 1,76 mol/h |

Reaction Result:

- Na_2SO_4 = 250,18 kg/h

Reaction remaining

- Na_2SO_3 = 193,82 kg/h

Reaction 2. $\text{NaOH} + \text{NO}$

Mass Number: Na = 23 H = 1
 O = 16 N = 14

| | | | | | | | | | |
|--------------------|-------------------|---|--------------|-------------------|------------------|---|----------------------|---|----------------------|
| Reaction | 2NaOH | + | 4NO | \leftrightarrow | 2NaNO_2 | + | N_2O | + | H_2O |
| Mass Rate | 4,516 kg/h | | 6,777 kg/h | | 7,79 kg/h | | 2,48 kg/h | | 1,01 kg/h |
| Mass Number | 40 | | 30 | | 69 | | 44 | | 18 |
| Mole Rate | 0,113 mol/h | | 0,226 mol/h | | 0,113 mol/h | | 0,056 mol/h | | 0,056 mol/h |

Reaction Result:

- NaNO_2 = 7,79 kg/h
- N_2O = 2,48 kg/h

- H_2O = 1,01 kg/h

Reaction Remaining:

- NO = 2,261 kg/h

Reaction 3. $\text{NaOH} + \text{NO}_2$

Mass Number: Na = 23 H = 1
 O = 16 N = 14

| | | | | | | | | | |
|--------------------|--------------------|---|----------------|-------------------|--------------------|---|--------------------|---|----------------------|
| Reaction | 2NaOH | + | 2NO_2 | \leftrightarrow | NaNO_2 | + | NaNO_3 | + | H_2O |
| Mass Rate | 708,47 kg/h | | 814,9 kg/h | | 611,06 kg/h | | 752,75 kg/h | | 159,55 kg/h |
| Mass Number | 40 | | 46 | | 69 | | 85 | | 18 |
| Mole Rate | 17,71 mol/h | | 17,71 mol/h | | 8,85 mol/h | | 8,85 mol/h | | 8,85 mol/h |

Reaction Result:

- NaNO_2 = 611,06 kg/h
- NaNO_3 = 752,75 kg/h
- H_2O = 159,55 kg/h

For NaOH addition for one scrubbing process, we need to know NaOH Required for all chemical reactions

Reaction 1. $\text{NaOH} + \text{SO}_2$

NaOH Required = 113,33 kg/h

Reaction 2. $\text{NaOH} + \text{NO}$

NaOH Required = 4,516 kg/h

Reaction 3. $\text{NaOH} + \text{NO}_2$

NaOH Required = 708,47 kg/h

So, the total NaOH required for one scrubbing process is:

$$\begin{aligned} \text{Total NaOH Required} &= 113,33 \text{ kg/h} + 4,516 \text{ kg/h} + 708,47 \text{ kg/h} \\ &= 826,31 \text{ kg/h} \end{aligned}$$

Then, calculating the flow rate of NaOH with following formula:

$$\text{NaOH Flow Rate} = \frac{\text{NaOH Required}}{\text{NaOH Density}}$$

$$\text{NaOH Flow Rate} = \frac{826,31 \text{ kg/h}}{2130 \text{ kg/m}^3}$$

Then, the flow rate of NaOH is 0,387 m³/h

4.11 Heat Exchange

Based on the exhaust gas content, this is the detail of exhaust gas content can be seen on table below

Table 4.10 Detail of Exhaust Gas Content

| Sub. | Total Vol. (m ³ /hr) | Content (%) | Content (m ³ /hr) | Density (kg/m ³) | Flow Mass (kg/hr) | Specific Heat, Cp (kJ/kgK) | m x Cp |
|------------------|---------------------------------|-------------|------------------------------|------------------------------|-------------------|----------------------------|----------------|
| N ₂ | 18736,49 | 76,0% | 14239,73527 | 1,0564 | 15042,85634 | 1,042 | 15674,66 |
| CO ₂ | | 10,0% | 1873,649377 | 1,6597 | 3109,696 | 0,8666 | 2694,862 |
| H ₂ O | | 3,0% | 562,0948132 | 0,6794 | 381,8872161 | 1,874 | 715,6566 |
| O ₂ | | 5,0% | 936,8246886 | 1,2068 | 1130,560 | 0,9217 | 1042,037 |
| SO ₂ | | 0,23% | 43,09393568 | 2,927 | 126,136 | 0,64 | 80,72701 |
| NO | | 0,30% | 56,20948132 | 1,34 | 75,32070496 | 0,995 | 74,9441 |
| NO ₂ | | 0,03% | 5,620948132 | 1450 | 8150,374791 | 4,69 | 38225,26 |
| CO | | 0,4% | 74,94597509 | 1,0563 | 79,16543348 | 1,039 | 82,25289 |
| Total | | | | | | | 58590,4 |

Where:

- ρ Water = 997 kg/m³
- m Water = 269578 kg/h
- cp water = 4.18 kJ/kgK
- m x cp Gas = 58590,4 kg/h

4.11.1 Calculation of Heat Exchange

$$\begin{aligned}
 Q_1 &= Q_2 \\
 m \times c \times \Delta T &= m \times c \times \Delta T \\
 269578 \times 4.18 \times (T_2 - 308,15) &= 58590,4 \times (553,15 - 323,15) \\
 T_2 - 308,15 &= 13475792 / 269578 \times 4.18 \\
 T_2 - 308,15 &= 11,95 \\
 T_2 &= 320,1 \text{ K} \\
 &= 46,95^\circ\text{C}
 \end{aligned}$$

4.11.2 Heat Exchange between Washwater and Seawater

Known:

- T Water Inlet = 46,95°C (320,1K)
- T Water Outlet = 35°C (308,15 K)
- m Water = 269578 kg/h
- cp Water = 4,18 kJ/kgK

so, the Calories released is

$$\begin{aligned}
 Q &= m \times c \times \Delta T \\
 Q &= 269578 \times 4.18 \times (320,1 - 308,15) \\
 Q &= 13465690,68 \text{ kJ/hr} \\
 Q &= 3740,46 \text{ kW} \\
 Q &= 5012,21 \text{ HP}
 \end{aligned}$$

4.11.3 Sea Water Coolant Required

known :

- T Water Inlet = 35°C = 308.15 K
- T Water Outlet = 50°C = 323,15 K
- Calories (Q) = 13465690,68 kJ/h
- cp Sea Water = 4.012 kJ/kgK

So, the mass of Sea Water can be calculated using the formula:

$$m = \frac{Q}{cp \times \Delta T}$$

Where:

m = Mass of Water

ΔT = Temperature difference (K)

So,

$$m = \frac{13465690,68}{4,012 \times (323,15 - 308,15)}$$

$$m = 223756,9 \text{ kg/hr}$$

$$\rho \text{ Sea Water} = 1025 \text{ kg/m}^3$$

$$\text{Sea Water Flow Rate} = 218,29 \text{ m}^3/\text{hr}$$

4.12 Tank Calculation

Because this ship is using scrubber as the modification to comply with IMO 2020, we need to calculate the tank capacity to contain NaOH, Expansion Tank, and Sludge tank for Scrubbing. It's also to know tank capacity required for this system

4.12.1 Calculation of Expansion Tank

$$\text{Fresh water tank in system} = 269,578 \text{ m}^3$$

$$\text{Tank size estimation} = 3-4 \%$$

$$\begin{aligned} \text{Expansion Tank Required} &= 269,578 \times 3,5\% \\ &= 9,435 \text{ m}^3 \end{aligned}$$

4.12.2 Calculation of NaOH Tank

$$\text{Flow rate} = 0,387 \text{ m}^3/\text{hr}$$

$$\begin{aligned} \text{Tank size Estimation} &= \text{Capacity of Exhaust gas} \\ &= 18736,49 \text{ m}^3/\text{h} \end{aligned}$$

$$\text{Cargo Tank} = 42072,403 \text{ m}^3$$

$$\begin{aligned} \text{NaOH Required tank} &= 42072,403 / 18736,49 \times 0,387 \\ &= 5,8 \text{ m}^3 \text{ per trip} \\ &= 11,6 \text{ m}^3 \end{aligned}$$

4.12.3 Calculation of Sludge Tank

Estimation of Sludge = 0,1 - 0,4 gr / MWh of Scrubbed engine

Power of Engine = 6,48 MW (Main Engine)
 = 1,3 MW (3 set of Auxiliary Engine; 3,9 mW)
 = 4,3 MW (Boiler)
 = 14,68 MW

Sludge Quantity = 0,3 x 14,68 x 23
 = 101,292 kg

Ash Density = 610 kg/m³

Sludge Tank Volume = 101,292 / 610
 = 0,16 m³

4.13 Pipe Calculation

The Scrubber system also requires a piping system, in this case, we used Carbon Steel pipe to recover all the piping systems of the Scrubber

4.13.1 NaOH Pipe Calculation

Flow Rate = 0,387 m³/hr
 Pipe Diameter = 14,95 mm
 = 0,01495 m
 Pipe Area = 3,14 x (0,01495)² /4
 = 0,0001754 m²
 flow rate = 0,387/0,0001754
 = 2206,38 m/h
 = 0,612 m/s

4.13.2 Fresh Water Pipe Calculation

| | |
|---------------|----------------------------------|
| Flow Rate | = 270 m ³ /hr |
| Pipe Diameter | = 261 mm |
| | = 0,261 m |
| Pipe Area | = 3,14 x (0,261) ² /4 |
| | = 0,0534 m ² |
| flow rate | = 270/0,0534 |
| | = 5056,17 m/h |
| | = 1,404 m/s |

4.13.3 Sea Water Pipe Calculation

| | |
|---------------|-----------------------------------|
| Flow Rate | = 467 m ³ /hr |
| Pipe Diameter | = 311,5 mm |
| | = 0,3115 m |
| Pipe Area | = 3,14 x (0,3115) ² /4 |
| | = 0,0761 m ² |
| flow rate | = 467/0,0761 |
| | = 6136,66 m/h |
| | = 1,704 m/s |

4.13.4 Makeup Water Pipe Calculation

| | |
|---------------|-----------------------------------|
| Flow Rate | = 20 m ³ /hr |
| Pipe Diameter | = 24,3 mm |
| | = 0,0243 m |
| Pipe Area | = 3,14 x (0,0243) ² /4 |
| | = 0,00463 m ² |
| flow rate | = 20/0,00463 |
| | = 4319,65 m/h |
| | = 1,199 m/s |

4.14 Pump Calculation

This system also requires a pump to transfer fluids for seawater, freshwater, and NaOH to do a scrubbing process. To know the required specs to flowing the fluid on Hybrid Loop Scrubber System

4.14.1 Sea Water Pump

a) Head Static (H_s)

Head static is the difference height of suction and the Scrubber (from the seachest)

- Head at $Z=0$ at Discharge = 17,73 m
- Head at $Z=0$ at Suction = 0 m

So, $H_s = 17,73 + 0 = 17,73$ m

b) Head Velocity (H_v)

Head velocity is the difference velocity of suction and discharge side. Since the velocity is same, which is 1,704 m/s each

$$H_v = (V^2_d - V^2_s) / 2 g$$

Where

$$g = 9,81 \text{ m/s}^2$$

$$H_v = (2,9-2,9) / 2 \times 9,81$$

$$= 0 \text{ m}$$

c) Head Pressure (H_p)

at Suction Side = Atmospheric Pressure + Hidrostatic Pressure

$$\begin{aligned} &= 101.325 \text{ N/m}^2 + (0 \rho g) \\ &= 101.325 \text{ N/m}^2 + (0 \times 1025 \times 9,81) \\ &= 101.325 \text{ N/m}^2 \end{aligned}$$

At Discharge side = 101.325 N/m²

$$H_p = (P_d - P_s) / \rho \times g$$

Where

$$\rho = 1025 \text{ kg/m}^3$$

$$g = 9,81 \text{ m/s}^2$$

$$H_p = (101.325 - 101.325) / (1025 \times 9,81)$$

H_p : 0 m

d) Reynold Number

For calculating reynold Number, you can use the formula below:

$$Rn = \frac{v \times dH}{n}$$

Where:

n = Kinematic Viscosity (0,000000796 N.s/m²)

dH = Inside diameter of Seawater pipe (0,3115 m)

v = Fluid Velocity of Seawater (1,704 m/s)

so,

$$\begin{aligned} Rn &= (1,704 \times 0,3115) / 0,000000796 \\ &= 666829,1 \end{aligned}$$

If $Rn < 2300$ is Laminar Flow and $Rn > 2300$ is Turbulent flow, in this case is turbulent flow.

Based on the calculation above, it is known that the flow is a turbulent flow. Therefore, the value of friction factor can be defined with Colebrook Equation.

$$\begin{aligned} f &= 0,02 + (0,0005/D) \\ &= 0,02 + (0,0005/0,3115) \\ &= 0,022 \end{aligned}$$

e) Major Losses (h_f) at Suction Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ suction}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at suction side (61,2 m)

g = Gravity (9,81 m/s²)

So, the major losses at the suction side of the pump is

$$h_{f \text{ suction}} = 0,022 \times 61,2 \times 1,704^2 / (0,3115 \times 2 \times 9,81)$$

$$= 0,639 \text{ m}$$

f) Minor Losses (h_m) at Suction Side

| No | Accessories | n | k | n x k |
|---------------|-----------------|---|-----|-------|
| 1 | Butterfly Valve | 7 | 0,4 | 2,8 |
| 2 | T joint | 5 | 1 | 5 |
| 3 | Elbow | 8 | 0,3 | 2,4 |
| 4 | Filter | 1 | 2,5 | 2,5 |
| 5 | NRV | 1 | 2 | 2 |
| $\Sigma nk =$ | | | | 14,7 |

So, the value of minor losses at suction side is:

$$\begin{aligned} h_{m \text{ suction}} &= \Sigma nk \times v^2 / 2g \\ &= 14,7 \times 1,704^2 / 2 \times 9,81 \\ &= 2,17 \text{ m} \end{aligned}$$

g) Total Head Loss at Suction Side

$$\begin{aligned} h_{L \text{ suction}} &= h_{f \text{ suction}} + h_{m \text{ suction}} \\ &= 0,639 + 2,17 \\ &= 2,809 \text{ m} \end{aligned}$$

h) Major Losses (h_f) at Discharge Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ discharge}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at discharge side (37 m)

g = Gravity (9,81 m/s²)

So, the major losses at the discharge side of the pump is

$$h_{f \text{ discharge}} = 0,022 \times 37 \times 1,704^2 / (0,3115 \times 2 \times 9,81)$$

$$= 0,386 \text{ m}$$

i) Minor Losses (h_m) at Discharge Side

| No | Accessories | n | k | n x k |
|----|------------------|---|---------------|-------|
| 1 | Non Return Valve | 1 | 2 | 2 |
| 2 | Butterfly Valve | 1 | 0,4 | 0,4 |
| 3 | T joint | 1 | 1 | 1 |
| 4 | Elbow 90 | 4 | 0,3 | 1,2 |
| | | | $\Sigma nk =$ | 4,6 |

So, the value of minor losses at discharge side is:

$$h_{m \text{ discharge}} = \Sigma nk \times v^2 / 2g$$

$$= 4,6 \times 1,704^2 / 2 \times 9,81$$

$$= 0,68 \text{ m}$$

j) Total Head Loss at Discharge Side

$$h_{L \text{ discharge}} = h_{f \text{ discharge}} + h_{m \text{ discharge}}$$

$$= 0,386 + 0,68$$

$$= 1,06 \text{ m}$$

k) Total Head Loss of Pump

$$h_{L \text{ pump}} = h_{L \text{ suction}} + h_{L \text{ discharge}}$$

$$= 2,809 + 1,06$$

$$= 3,869 \text{ m}$$

l) Head Total of Pump

$$H_{\text{pump}} = H_s + H_v + H_p + H_L + H_E$$

$$= 17,73 + 0 + 0 + 3,869 + 12,75$$

$$= 34,34 \text{ m}$$

m) Heat Exchanger

This ship is using Hisaka LX-30 which is have 1,25 MPa means have 12,75 meter head

n) Required Pump's Specification

Head: 34,34 m

Capacity: 467 m³/h

4.14.2 Fresh Water Pump

a) Head Static (H_s)

Head static is the difference height of suction and the Scrubber (from the Expansion Tank)

- Head at Z= 0 at Discharge = 10,59 m
- Head at Z= 0 at Suction = 0 m

So, H_s = 10,59 + 0 = 10,59 m

b) Head Velocity (H_v)

Head velocity is the difference velocity of suction and discharge side is same, which is 1,404 m/s each

$$H_v = (V^2_d - V^2_s) / 2 g$$

Where

$$g = 9,81 \text{ m/s}^2$$

$$H_v = (1,97-1,97) / 2 \times 9,81$$

$$= 0 \text{ m}$$

c) Head Pressure (H_p)

at Suction Side = Atmospheric Pressure + Hidrostatic Pressure

$$\begin{aligned} &= 101.325 \text{ N/m}^2 + (0 \rho g) \\ &= 101.325 \text{ N/m}^2 + (0 \times 1000 \times 9,81) \\ &= 101.325 \text{ N/m}^2 \end{aligned}$$

At Discharge side = 101.325 N/m²

$$H_p = (P_d - P_s) / \rho \times g$$

Where

$$\rho = 1000 \text{ kg/m}^3$$

$$g = 9,81 \text{ m/s}^2$$

$$H_p = (101.325 - 101.325) / (1000 \times 9,81)$$

$$H_p: 0 \text{ m}$$

d) Reynold Number

For calculating reynold Number, you can use the formula below:

$$Rn = \frac{v \times dH}{n}$$

Where:

n = Kinematic Viscosity (0,000000796 N.s/m²)

dH = Inside diameter of Freshwater (0,261 m)

v = Fluid Velocity of Freshwater (1,404 m/s)

so,

$$Rn = (1,404 \times 0,261) / 0,000000796$$

$$= 460356,8$$

If $Rn < 2300$ is Laminar Flow and $Rn > 2300$ is Turbulent flow, in this case is turbulent flow.

Based on the calculation above, it is known that the flow is a turbulent flow. Therefore, the value of friction factor can be defined with Colebrook Equation.

$$f = 0.02 + (0.0005/D)$$

$$= 0,02 + (0,0005/0,261)$$

$$= 0,022$$

e) Major Losses (h_f) at Suction Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ suction}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at suction side (45,5 m)

g = Gravity (9,81 m/s²)

So, the major losses at the suction side of the pump is

$$\begin{aligned} h_{f \text{ suction}} &= 0,022 \times 45,5 \times 1,404^2 / (0,261 \times 2 \times 9,81) \\ &= 0,38 \text{ m} \end{aligned}$$

f) Minor Losses (h_m) at Suction Side

| No | Accessories | n | k | n x k |
|----|-----------------|---|---------------|-------|
| 1 | Butterfly Valve | 6 | 0,4 | 2,4 |
| 2 | T joint | 5 | 1 | 5 |
| 3 | Elbow | 4 | 0,3 | 1,2 |
| 4 | Filter | 2 | 2,5 | 5 |
| 5 | NRV | 1 | 2 | 2 |
| | | | $\Sigma nk =$ | 15,6 |

So, the value of minor losses at suction side is:

$$\begin{aligned} h_{m \text{ suction}} &= \Sigma nk \times v^2 / 2g \\ &= 15,6 \times 1,404^2 / 2 \times 9,81 \\ &= 1,56 \text{ m} \end{aligned}$$

g) Total Head Loss at Suction Side

$$\begin{aligned} h_{L \text{ suction}} &= h_{f \text{ suction}} + h_{m \text{ suction}} \\ &= 0,38 + 1,56 \\ &= 1,94 \text{ m} \end{aligned}$$

h) Major Losses (h_f) at Discharge Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ discharge}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at discharge side (38,2 m)

g = Gravity (9,81 m/s²)

So, the major losses at the discharge side of the pump is

$$\begin{aligned} h_{f \text{ discharge}} &= 0,022 \times 38,2 \times 1,404^2 / (0,261 \times 2 \times 9,81) \\ &= 0,323 \text{ m} \end{aligned}$$

i) Minor Losses (h_m) at Discharge Side

| No | Accessories | n | k | n x k |
|---------------|-----------------|---|-----|-------|
| 1 | NRV | 0 | 2 | 0 |
| 2 | Butterfly Valve | 2 | 0,4 | 0,8 |
| 3 | T joint | 1 | 1 | 1 |
| 4 | Elbow 90 | 4 | 0,3 | 1,2 |
| $\Sigma nk =$ | | | | 3 |

So, the value of minor losses at discharge side is:

$$\begin{aligned} h_{m \text{ discharge}} &= \Sigma nk \times v^2 / 2g \\ &= 3 \times 1,404^2 / 2 \times 9,81 \\ &= 0,3 \text{ m} \end{aligned}$$

j) Total Head Loss at Discharge Side

$$\begin{aligned} h_{L \text{ discharge}} &= h_{f \text{ discharge}} + h_{m \text{ discharge}} \\ &= 0,323 + 0,3 \\ &= 0,623 \text{ m} \end{aligned}$$

k) Total Head Loss of Pump

$$\begin{aligned}
 h_{L \text{ pump}} &= h_{L \text{ suction}} + h_{L \text{ discharge}} \\
 &= 1,94 + 0,623 \\
 &= 2,56 \text{ m}
 \end{aligned}$$

l) Head Total of Pump

$$\begin{aligned}
 H_{\text{pump}} &= H_s + H_v + H_p + H_L + H_E \\
 &= 10,59 + 0 + 0 + 2,56 + 12,75 \\
 &= 25,9 \text{ m}
 \end{aligned}$$

m) Heat Exchanger

This ship is using Hisaka LX-30 which is have 1,25 MPa means have 12,75 meter head

n) Required Pump's Specification

Head: 25,9 m

Capacity: 300 m³/h

4.14.3 NaOH Pump**a) Head Static (H_s)**

Head static is the difference height of suction and the Scrubber (from NaOH Tank)

- Head at Z= 0 at Discharge = 3 m
- Head at Z= 0 at Suction = 0 m

So, $H_s = 3 + 0 = 3 \text{ m}$

b) Head Velocity (Hv)

Head velocity is the difference velocity of suction and discharge side. In this case, the velocity is same, which is 0,612 m/s each

$$Hv = (V^2d - V^2s) / 2 g$$

Where

$$g = 9,81 \text{ m/s}^2$$

$$\begin{aligned} Hv &= (0,37-0,37) / 2 \times 9,81 \\ &= 0 \text{ m} \end{aligned}$$

c) Head Pressure (Hp)

Head pressure is the difference pressure of suction and discharge side. The design pressure of both side is same, so the head pressure is 0.

$$\begin{aligned} \text{at Suction Side} &= \text{Atmospheric Pressure} + \text{Hidrostatic Pressure} \\ &= 101.325 \text{ N/m}^2 + (0 \rho g) \\ &= 101.325 \text{ N/m}^2 + (0 \times 1500 \times 9,81) \\ &= 101.325 \text{ N/m}^2 \end{aligned}$$

$$\text{At Discharge side} = 101.325 \text{ N/m}^2$$

$$Hp = (Pd - Ps) / \rho \times g$$

Where

$$\rho = 1500 \text{ kg/m}^3$$

$$g = 9,81 \text{ m/s}^2$$

$$\begin{aligned} Hp &= (101.325 - 101.325) / (1000 \times 9,81) \\ Hp &: 0 \text{ m} \end{aligned}$$

d) Reynold Number

For calculating reynold Number, you can use the formula below:

$$Rn = \frac{v \times dH}{n}$$

Where:

n = Kinematic Viscosity (0,085 N.s/m²)

dH = Inside diameter of NaOH pipe (0,01495 m)

v = Fluid Velocity of NaOH (0,612 m/s)

so,

$$Rn = (0,635 \times 0,01495) / 0,085$$

$$= 0,1$$

If $Rn < 2300$ is Laminar Flow and $Rn > 2300$ is Turbulent flow, in this case is Laminar flow.

Based on the calculation above, it is known that the flow is a laminar flow. Therefore, the value of friction factor can be defined with Colebrook Equation.

$$f = 0.02 + (0.0005/D)$$

$$= 0,02 + (0,0005/0,01495)$$

$$= 0,053$$

e) Major Losses (h_f) at Suction Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ suction}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at suction side (0,76 m)

g = Gravity (9,81 m/s²)

So, the major losses at the suction side of the pump is

$$h_{f \text{ suction}} = 0,053 \times 0,76 \times 0,612^2 / (0,01495 \times 2 \times 9,81)$$

$$= 0,05 \text{ m}$$

f) Minor Losses (h_m) at Suction Side

| No | Accessories | n | k | n x k |
|----|-------------|---|---------------|-------|
| 1 | Gate Valve | 0 | 0,14 | 0 |
| 2 | T joint | 0 | 1 | 0 |
| 3 | Elbow | 0 | 0,3 | 0 |
| | | | $\Sigma nk =$ | 0 |

So, the value of minor losses at suction side is:

$$\begin{aligned}
 h_{m \text{ suction}} &= \Sigma nk \times v^2 / 2g \\
 &= 0 \times 0,612^2 / 2 \times 9,81 \\
 &= 0 \text{ m}
 \end{aligned}$$

g) Total Head Loss at Suction Side

$$\begin{aligned}
 h_{L \text{ suction}} &= h_{f \text{ suction}} + h_{m \text{ suction}} \\
 &= 0,05 + 0 \\
 &= 0,05 \text{ m}
 \end{aligned}$$

h) Major Losses (h_f) at Discharge Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ discharge}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at discharge side (3,2 m)

g = Gravity (9,81 m/s²)

So, the major losses at the suction side of the pump is

$$\begin{aligned}
 h_{f \text{ discharge}} &= 0,053 \times 3,2 \times 0,612^2 / (0,01495 \times 2 \times 9,81) \\
 &= 0,22 \text{ m}
 \end{aligned}$$

i) Minor Losses (h_m) at Discharge Side

| No | Accessories | n | k | n x k |
|----|-------------|---|---------------|-------|
| 1 | NRV | 1 | 2 | 2 |
| 2 | Gate Valve | 0 | 0,14 | 0 |
| 3 | T joint | 0 | 0 | 0 |
| 4 | Elbow 90 | 2 | 0,3 | 0,6 |
| | | | $\Sigma nk =$ | 2,6 |

So, the value of minor losses at discharge side is:

$$\begin{aligned}
 h_{m \text{ discharge}} &= \Sigma nk \times v^2 / 2g \\
 &= 2,6 \times 0,612^2 / 2 \times 9,81 \\
 &= 0,049 \text{ m}
 \end{aligned}$$

j) Total Head Loss at Discharge Side

$$\begin{aligned}
 h_{L \text{ discharge}} &= h_{f \text{ discharge}} + h_{m \text{ discharge}} \\
 &= 0,22 + 0,049 \\
 &= 0,269 \text{ m}
 \end{aligned}$$

k) Total Head Loss of Pump

$$\begin{aligned}
 h_{L \text{ pump}} &= h_{L \text{ suction}} + h_{L \text{ discharge}} \\
 &= 0,05 + 0,269 \\
 &= 0,319 \text{ m}
 \end{aligned}$$

l) Head Total of Pump

$$\begin{aligned}
 H_{\text{pump}} &= H_s + H_v + H_p + H_L \\
 &= 3 + 0 + 0 + 0,319 \\
 &= 3,319 \text{ m}
 \end{aligned}$$

m) Required Pump's Specification

Head: 3,319 m

Capacity: 0,387 m³/h

4.14.4 Makeup Water Pump

a) Head Static (H_s)

Head static is the difference height of suction and Expansion Tank

- Head at $Z=0$ at Discharge = 0 m
- Head at $Z=0$ at Suction = 0 m

So, $H_s = 0$ m

b) Head Velocity (H_v)

Head velocity is the difference velocity of suction and discharge side is same, is 1,404 m/s each

$$H_v = (V^2_d - V^2_s) / 2 g$$

Where

$$g = 9,81 \text{ m/s}^2$$

$$H_v = (1,97-1,97) / 2 \times 9,81$$

$$= 0 \text{ m}$$

c) Head Pressure (H_p)

Head pressure is the difference pressure of suction and discharge side. The design pressure of both side is same, so the head pressure is 0.

$$\begin{aligned} \text{at Suction Side} &= \text{Atmospheric Pressure} + \text{Hidrostatic Pressure} \\ &= 101.325 \text{ N/m}^2 + (0 \rho g) \\ &= 101.325 \text{ N/m}^2 + (0 \times 1000 \times 9,81) \\ &= 101.325 \text{ N/m}^2 \end{aligned}$$

$$\text{At Discharge side} = 101.325 \text{ N/m}^2$$

$$H_p = (P_d - P_s) / \rho \times g$$

Where

$$\rho = 1000 \text{ kg/m}^3$$

$$g = 9,81 \text{ m/s}^2$$

$$H_p = (101.325 - 101.325) / (1000 \times 9,81)$$

$$H_p: 0 \text{ m}$$

d) Reynold Number

For calculating reynold Number, you can use the formula below:

$$Rn = \frac{v \times dH}{n}$$

Where:

n = Kinematic Viscosity (0,000000796 N.s/m²)

dH = Inside diameter of Freshwater pipe (0,0243 m)

v = Fluid Velocity of Freshwater (1,199 m/s)

so,

$$Rn = (1,199 \times 0,0243) / 0,000000796$$

$$= 36602,63$$

If $Rn < 2300$ is Laminar Flow and $Rn > 2300$ is Turbulent flow, in this case is Turbulent flow.

Based on the calculation above, it is known that the flow is a Turbulent flow. Therefore, the value of friction factor can be defined with Colebrook Equation.

$$f = 0,02 + (0,0005/D)$$

$$= 0,02 + (0,0005/0,0243)$$

$$= 0,041$$

e) Major Losses (h_f) at Suction Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ suction}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

L = Pipe Length at suction side (1,37 m)

$g = \text{Gravity } (9,81 \text{ m/s}^2)$

So, the major losses at the suction side of the pump is

$$h_{f \text{ suction}} = 0,041 \times 1,37 \times 1,199^2 / (0,0243 \times 2 \times 9,81)$$

$$= 0,17 \text{ m}$$

f) Minor Losses (h_m) at Suction Side

| No | Accessories | n | k | n x k |
|----|-------------|---|---------------|-------|
| 1 | Gate Valve | 0 | 0,14 | 0 |
| 2 | T joint | 0 | 1 | 0 |
| 3 | Elbow | 0 | 0,3 | 0 |
| | | | $\Sigma nk =$ | 0 |

So, the value of minor losses at suction side is:

$$h_{m \text{ suction}} = \Sigma nk \times v^2 / 2g$$

$$= 0 \times 1,199^2 / 2 \times 9,81$$

$$= 0$$

g) Total Head Loss at Suction Side

$$h_{L \text{ suction}} = h_{f \text{ suction}} + h_{m \text{ suction}}$$

$$= 0,17 + 0$$

$$= 0,17 \text{ m}$$

h) Major Losses (h_f) at Discharge Side

For Major losses, we can calculate the major losses using the formula below

$$h_{f \text{ discharge}} = \frac{f \times L \times v^2}{D \times 2g}$$

Where:

$L = \text{Pipe Length at discharge side } (12,22\text{m})$

$g = \text{Gravity } (9,81 \text{ m/s}^2)$

So, the major losses at the discharge side of the pump is

$$h_{f \text{ discharge}} = 0,041 \times 12,22 \times 1,199^2 / (0,01495 \times 2 \times 9,81)$$

$$= 1,5 \text{ m}$$

i) Minor Losses (h_m) at Discharge Side

| No | Accessories | n | k | n x k |
|----|-------------|---|---------------|-------|
| 1 | NRV | 1 | 2 | 2 |
| 2 | Gate Valve | 0 | 0,14 | 0 |
| 3 | T joint | 0 | 1 | 0 |
| 4 | Elbow 90 | 0 | 0,3 | 0 |
| | | | $\Sigma nk =$ | 2 |

So, the value of minor losses at discharge side is:

$$\begin{aligned}
 h_{m \text{ discharge}} &= \Sigma nk \times v^2 / 2g \\
 &= 2 \times 1,199^2 / 2 \times 9,81 \\
 &= 0,146 \text{ m}
 \end{aligned}$$

j) Total Head Loss at Discharge Side

$$\begin{aligned}
 h_{L \text{ discharge}} &= h_{f \text{ discharge}} + h_{m \text{ discharge}} \\
 &= 1,5 + 0,146 \\
 &= 1,646 \text{ m}
 \end{aligned}$$

k) Total Head Loss of Pump

$$\begin{aligned}
 h_{L \text{ pump}} &= h_{L \text{ suction}} + h_{L \text{ discharge}} \\
 &= 0,17 + 1,646 \\
 &= 1,82 \text{ m}
 \end{aligned}$$

l) Head Total of Pump

$$\begin{aligned}
 H_{\text{pump}} &= H_s + H_v + H_p + H_L \\
 &= 0 + 0 + 0 + 1,82 \\
 &= 1,82 \text{ m}
 \end{aligned}$$

m) Required Pump's Specification

Head: 1,82 m

Capacity: 20 m³

4.15 Summary list of Electrical Load

Table 4.11 Summary list of Electrical Load

| READY RECKONER OF POWER CONSUMPTION | | | | | | | | |
|-------------------------------------|----------------------|------------------|------------------|-----------------------|---------------|-----------------|---------------|-----------|
| | | NORMAL SERVICE | DEP. & ARR./PORT | NAV. WITH TANK CLEAN. | CARGO SERVICE | HARBOUR SERVICE | EM'CY SERVICE | |

| | | REQUIRED POWER | | | | 260.9 | | |
| | TOTAL POWER (KW) | | | | | 1126.3 | | |
| | OUTPUT OF GEN. | | | | | 1300KW x 1 | | |
| LOAD FACTOR OF GEN. | | | | | 86.6% | | | |

4.16 Scrubber Specifications

This ship will be retrofitted with a scrubber with following specifications:

Table 4.12 Scrubber Specifications

| Description | Value |
|---------------|--------|
| Model | U-Type |
| Diameter (mm) | 2700 |
| Length (mm) | 5300 |
| Height (mm) | 8700 |
| Weight (tons) | 16,9 |

4.17 Water Consumption for Scrubber Use

Based on the Project guide of Scrubber, we use 2 different capacities that seen on the table below

Table 4.13 Water Consumption for Scrubber Use

| Operation Condition | Open Loop | Closed Loop |
|----------------------------------|-----------------------|-----------------------|
| Sea Water Pump to Scrubber | 467 m ³ /h | |
| Fresh Water Pump for Circulating | | 300 m ³ /h |

4.18 Power Consumption for Scrubber

Table 4.14 Power Consumption of Scrubber usage

| Item | Operation (kW) | Open Loop (kW) | Closed Loop (kW) | Load (%) |
|----------------------------|----------------|----------------|------------------|----------|
| No. 1 Sealing Air Fan | 6,4 | 6,4 | 6,4 | 100 |
| No. 2 Sealing Air Fan | 6,4 | | | 0 |
| No. 1 S.W Feed Pump | 98 | 98 | 98 | 100 |
| No. 2 S.W Feed Pump | 98 | 0 | 0 | 0 |
| No. 1 F.W Circulating Pump | 45 | | 45 | 100 |
| No. 2 F.W Circulating Pump | 45 | | 0 | 0 |
| Makeup Water Pump | 5,5 | | 5,5 | 100 |
| NaOH Pump | 0,18 | | 0,18 | 100 |
| Others | 16,5 | 16,5 | 16,5 | 100 |
| Wash Water Treatment | 6 | | 6 | 100 |
| Total | | 120,9 | 177,58 | |

4.19 Pumps for Scrubber

After we calculate the head and knowing capacity requirement, we need to choose the right pump for scrubbing process, the result is on the table below

4.19.1 Sea Water Pump

Table 4.15 Sea Water Pump (Goulds 3181 M)

| Description | Value |
|------------------------------|-------------------|
| Capacity (m ³ /h) | 467 |
| Head (m) | 50 |
| Motor (kW) | 98 @1800 rpm |
| Type | Vert. Centrifugal |
| Control | VFD |
| Quantity | 2 |

4.19.2 Fresh Water Pump

Table 4.16 Fresh Water Pump (Taiko EMC250-C)

| Description | Value |
|------------------------------|--------------|
| Capacity (m ³ /h) | 300 |
| Head (m) | 28,9 |
| Motor (kW) | 45 @1800 rpm |
| Type | Centrifugal |
| Control | VFD |
| Quantity | 2 |

4.19.3 NaOH Pump

Table 4.17 NaOH Pump (Teflow CQB20-15-75F)

| Description | Value |
|------------------------------|----------------|
| Capacity (m ³ /h) | 1,6 |
| Head (m) | 7 |
| Motor (kW) | 0,18 @2900 rpm |
| Type | Magnetic |
| Control | VFD |
| Quantity | 1 |

4.19.4 Makeup Water Pump

Table 4.18 Makeup Water Pump (Taiko EMC100-C)

| Description | Value |
|------------------------------|---------------|
| Capacity (m ³ /h) | 20 |
| Head (m) | 1,7 |
| Motor (kW) | 5,5 @1800 rpm |
| Type | Centrifugal |
| Control | VFD |
| Quantity | 1 |

4.20 Fans

4.20.1 Sealing Air Fan

Table 4.19 Sealing Air Fan (Kruger ASA 355)

| Description | Value |
|------------------------------|-------|
| Static Head (Pa) | 5000 |
| Capacity (m ³ /h) | 2500 |
| Motor (kW) | 6,4 |
| Quantity | 2 |

4.21 Others

At this case, we choose the right equipment to be installed on the Scrubber system, the data of selected component is on the table below, including pipe, wash water treatment, fittings, etc.

4.21.1 Wash Water Treatment

Table 4.20 Wash Water Treatment

| | |
|-----------------|---------------------|
| Brand | Wartsila SWT 500 |
| Capacity | 5 m ³ /h |
| Power | 6 kW |

4.21.2 Heat Exchanger

Table 4.21 Heat Exchanger

| | |
|---------------------------------|-----------------------|
| Merk | Hisaka LX-30 |
| Max. Flow Rate | 481 m ³ /h |
| Max. Working Temperature | 180 °C |
| Max. Working Pressure | 12,5 Bar |

4.21.3 Pipe and Fittings

Table 4.22 Pipe List

| No | Material | Nominal Diameter | length | Schedule |
|----|--------------|------------------|--------|----------|
| | | | 13,59 | |
| 1 | Carbon Steel | 20 mm | m | 40 |
| 2 | Carbon Steel | 250 mm | 83,7 m | 40 |
| 3 | Carbon steel | 10 mm | 3,47 m | 40 |
| 4 | Carbon steel | 300 mm | 98,2 m | 40 |

Table 4.23 Fittings list

| No | Item | Size | Qty. |
|----|--------------------|--------|------|
| 1 | Butterfly Valve | 300 mm | 8 |
| 2 | Elbow 90 | 300mm | 12 |
| 3 | Filter | 300 mm | 1 |
| 4 | NRV | 300 mm | 2 |
| 5 | T Joint | 300 mm | 5 |
| 6 | Elbow 90 | 250 mm | 8 |
| 7 | Filter | 250 mm | 2 |
| 8 | NRV | 250 mm | 1 |
| 9 | T Joint | 250 mm | 5 |
| 10 | Butterfly Valve | 250 mm | 8 |
| 11 | Gate Valve | 20 mm | 0 |
| 12 | Butterfly Valve | 25 mm | 0 |
| 13 | Elbow 90 | 10 mm | 2 |
| 14 | T Joint | 10 mm | 0 |
| 15 | Pressure Indicator | | 12 |
| 16 | Safety Valve | 5 Bar | 3 |
| 17 | Level Alarm | | 3 |
| 18 | Sounding Pipe | | 2 |
| 19 | NRV | 20 mm | 1 |
| 20 | NRV | 10 mm | 1 |

4.22 Electrical Load after Scrubber Attachment

Electrical load of all components are supplied by generator, generator uses to supply all electrical component on the ship. If more components it means more load to be supplied by generator. So, we need to recalculate load factor to know the new demand power for this ship.

Table 4.24 Electrical load before Scrubber Attachment

| Item | | Sea going | Manuvering | Cargo Operation | Harbour | Emergency |
|--|------------------|---------------|---------------|-----------------|---------------|---------------|
| Intermittent load (kW) | Total | 522,1 | 649,4 | 639,8 | 573,1 | 0 |
| | Diversity factor | 1,5 | 1,5 | 1,5 | 1,5 | 1,5 |
| | Demand power | 348,1 | 432,9 | 426,5 | 382,1 | 0,0 |
| Continous load (kW) | Demand power | 500,4 | 500,4 | 1727,4 | 393,77 | 117,5 |
| Total continous & intermitten load | | 848,47 | 933,33 | 2153,93 | 775,84 | 117,50 |
| Design margin (2%) (kW) | | 16,97 | 18,67 | 43,08 | 15,52 | 2,35 |
| Total demand power with provision for design margin (kw) | | 865,44 | 952,00 | 2197,01 | 791,35 | 119,85 |

In the table above, this is the old electrical load data and we calculate the new factor of continous load, will be

New CL = Old CL + (Load Factor x Required power for scrubbing)

$$= 1727,4 + (1 \times 177,58)$$

$$= 1904,98 \text{ kW}$$

Total demand power = Total IL & CL x (1 + design margin)

$$= 426,5 + 1904,98 \times (1 + 2\%)$$

$$= 2369,6 \text{ kW}$$

Then, we calculate the new load factor of Generator and the result is

Load Factor = Required power / Total generator power

$$= 2369,6 / (1300 \times 2)$$

$$= 91\%$$

and, if we use all generators, the new percentage will be

$$\begin{aligned}\text{Load Factor} &= \text{Required power} / \text{Total generator power} \\ &= 2369,6 / (1300 \times 3) \\ &= 60,75 \%\end{aligned}$$

And then, we calculate the start power, and the total is

$$\begin{aligned}\text{Start Power} &= \text{Loading Unloading (w/o Cargo oil pump)} + \text{Cargo Oil Pump} \\ &= 670,06 + (618,28 \times 3) \\ &= 2524,9 \text{ kW}\end{aligned}$$

And the generator efficiency is:

$$\begin{aligned}\text{Generator Efficiency} &= \text{Start power} / \text{total generator force} \\ &= 2524,9 / (1300 \times 3) \\ &= 64,74\%\end{aligned}$$

4.23 Cost Estimation

Next, we need to find all components and prices, so all components and prices can be seen on the table below

4.23.1 Cost Estimation of All Components

Table 4.25 Cost Estimation of All components

| No | Item | Specification | Quantity | Unit Cost | Total Cost |
|----|--------------------------------|---------------|-----------|----------------|-------------------|
| 1 | Sea Water Pump | | 2 pcs | Rp 933.600.000 | Rp 1.867.200.000 |
| 2 | Fresh Water Pump | | 2 pcs | Rp 139.495.400 | Rp 278.990.800 |
| 3 | NaOH Pump | | 2 pcs | Rp 6.410.720 | Rp 12.821.440 |
| 4 | Heat Exchanger | | 1 pcs | Rp 7.780.000 | Rp 7.780.000 |
| 5 | Wash Water Treatment | | 1 pcs | Rp 141.265.000 | Rp 141.265.000 |
| 6 | Carbon Steel Pipe | 300 mm | 322,19 ft | Rp 10.182.620 | Rp 3.280.781.105 |
| 7 | Carbon Steel Pipe | 250 mm | 274,62 ft | Rp 10.182.620 | Rp 2.796.348.050 |
| 8 | Carbon Steel Pipe | 20 mm | 44,59 ft | Rp 14.988.014 | Rp 668.297.409 |
| 9 | Carbon Steel Pipe | 10 mm | 11,39 ft | Rp 16.131.986 | Rp 183.663.790 |
| 10 | Butterfly Valve | 12" | 8 pcs | Rp 1.556.000 | Rp 12.448.000 |
| 11 | Butterfly Valve | 10" | 8 pcs | Rp 3.656.600 | Rp 29.252.800 |
| 12 | Elbow 90 | 12" | 12 pcs | Rp 155.600 | Rp 1.867.200 |
| 13 | Elbow 90 | 0,4" | 2 pcs | Rp 311.200 | Rp 622.400 |
| 14 | Elbow 90 | 10" | 8 pcs | Rp 933.600 | Rp 7.468.800 |
| 15 | NRV | 12" | 2 pcs | Rp 1.400.400 | Rp 2.800.800 |
| 16 | NRV | 10" | 1 pcs | Rp 1.322.600 | Rp 1.322.600 |
| 17 | NRV | 3/4" | 1 pcs | Rp 933.600 | Rp 933.600 |
| 18 | NRV | 0,4" | 1 pcs | Rp 778.000 | Rp 778.000 |
| 19 | Filter | 12" | 1 pcs | Rp 2.053.920 | Rp 2.053.920 |
| 20 | Filter | 10" | 2 pcs | Rp 2.053.920 | Rp 4.107.840 |
| 21 | T Joint | 12" | 5 pcs | Rp 142.500 | Rp 712.500 |
| 22 | T Joint | 10" | 5 pcs | Rp 142.500 | Rp 712.500 |
| 23 | Level Alarm | | 3 pcs | Rp 169.000 | Rp 507.000 |
| 24 | Sealing Air fan | 2500 m3/h | 2 pcs | Rp 9.930.236 | Rp 19.860.472 |
| 25 | Plastic Tank | 1000 l | 2 pcs | Rp 1.000.000 | Rp 2.000.000 |
| 26 | Scrubber Tower | | 1 pcs | Rp 389.000.000 | Rp 389.000.000 |
| 27 | Sensor package | | 2 pcs | Rp 113.577.975 | Rp 227.155.950 |
| 28 | Makeup Water Pump | | 1 pcs | Rp 20.383.600 | Rp 20.383.600 |
| 29 | Temperature Indicator | | 2 pcs | Rp 209.000 | Rp 418.000 |
| 30 | Pressure Indicator | | 12 pcs | Rp 209.000 | Rp 2.508.000 |
| 31 | Sounding Pipe | | 2 pcs | Rp 18.672.000 | Rp 37.344.000 |
| 32 | Safety Valve | | 6 pcs | Rp 209.000 | Rp 1.254.000 |
| 33 | Emission Monitoring (Scrubber) | | 1 pcs | Rp 113.577.975 | Rp 113.577.975 |
| | | | | Total | Rp 10.116.237.550 |

Based on the table above, the total price is 10,116 Billion Rupiah

4.23.2 Direct Costs

Direct costs is based on Equipment Cost, Instrumentation, Tax, and freight. Tax is based on Bea Cukai, which is now Import Duty is 7,5% and PPN 10% , the rest is based on HarlanH.

Table 4.26 Direct Costs

| Direct Costs | |
|-----------------------|----------------------|
| Equipment Cost | Rp 10.116.237.550,00 |
| Instrumentation (10%) | Rp 1.011.623.755,00 |
| Sales Taxes (17,5%) | Rp 1.770.341.571,25 |
| Freight (5%) | Rp 505.811.877,50 |
| Total Direct Costs | Rp 13.404.014.753,75 |

4.23.3 Direct Installation Costs

The price of Direct Installation costs are based on total direct costs that we calculated before for Scrubber modification on this ship, and the price based on IPERINDO 2019, can be seen on attachments.

Table 4.27 Direct Installation Costs

| Direct Installation costs | |
|---------------------------|---------------------|
| As Summarized | Rp 3.096.412.615,00 |

4.23.4 Indirect Costs

Indirect Installation costs are also based on Direct Costs.

Table 4.28 Indirect Costs

| Indirect Costs | |
|---------------------------------------|---------------------|
| Engineering (10%) | Rp 1.340.401.475,38 |
| Construction and Field Expenses (10%) | Rp 1.340.401.475,38 |
| Contractor Fees (10%) | Rp 1.340.401.475,38 |
| Start up (1%) | Rp 134.040.147,54 |
| Performance Test | - |
| Model Study (3%) | Rp 402.120.442,61 |
| Contingencies (3%) | Rp 402.120.442,61 |
| Total Indirect Costs | Rp 4.959.485.458,89 |

4.23.5 Total Costs

Table 4.29 Total Costs

| Summary | |
|-----------------------------------|----------------------|
| Total Costs (USD) | \$ 1.379.171,77 |
| Total Costs (EURO) | € 1.282.629,75 |
| Total Costs (IDR) | Rp 21.459.912.787,10 |
| Cost Estimated by Berqvist et al. | € 3.000.000,00 |
| Estimated difference (€) | € 1.717.418,06 |
| Estimated difference(%) | 57% |

4.24 Operational Expenditure Calculation

After Scrubber attachment, we need to analyze the economical aspect between Open Loop and Closed Loop, and also we need to predict the cost for all equipment's spare parts by calculating the total cost. so, we will know the operational costs after scrubber installation.

4.24.1 Component Cost for Operational Expenditure

Table 4.30 Component Cost for OPEX

| Component List | | | | | | |
|----------------|-----------------------|---|-----|------|-----------------------------|-------------------------|
| No | Item | Specification | Qty | Unit | Cost / Item | Total Cost |
| 1 | Sea Water Pump | Brand : Goulds 3181 M Flow Rate : 467 m3/h Head : 50 m Power : 98 kW | 2 | Pcs | Rp 933.600.000 | Rp 1.867.200.000 |
| 2 | Fresh Water Pump | Brand : Taiko EMC250-C Capacity : 300 m3/h Head : 28,9 m Power : 45 kW | 2 | Pcs | Rp 139.495.400 | Rp 278.990.800 |
| 3 | NaOH Pump | Brand : Teflow CQB20-15-75F Capacity : 1,6 m3/h Head : 7 m Power : 0,18 kW | 2 | Pcs | Rp 6.410.720 | Rp 12.821.440 |
| 4 | Makeup Water Pump | Brand : Taiko EMC100-C Capacity : 20 m3/h Head : 7 m Power : 5,5 kW | 1 | Pcs | Rp 20.383.600 | Rp 20.383.600 |
| 4 | Heat Exchanger | Brand : Hisaka LX-30 Max. Flow Rate : 481 m3/h Max. Working Temperature : 180°C Max. Working Pressure : 12,5 Bar | 1 | Pcs | Rp 7.780.000 | Rp 7.780.000 |
| 5 | Wash Water Treatment | Brand : Wartsila SWT 500 Capacity : 5 m3/h Power : 6 kW | 1 | Pcs | Rp 141.265.000 | Rp 141.265.000 |
| 6 | Component Spare Parts | 5% of Component Cost | | | | Rp 116.422.042 |
| | | | | | Total Component Cost | Rp 2.444.862.882 |

4.24.2 Additional Fuel Consumption

Table 4.31 Additional Fuel Consumption

| Fuel Consumption Cost Calculation | | | | |
|-----------------------------------|--|--|-----------|--------|
| No | Formula/Data | Information | Value | Unit |
| 1 | Equipment's Power Consumption | Sea Water Pump : 98 kW x 2 Fresh Water Pump : 45 x 2 NaOH Pump : 0,18 kW x 2 Wash Water Treatment : 6 kW Makeup Water Pump: 5,5 kW | 297,86 | kW |
| 2 | <i>Exhaust gas production</i> $t = V/Q$ | $t = (42072,403 / 18736,49) \times 2$ | 4,49 | hour |
| 3 | Equipment's Energy Consumption $kWh = P \times t$ | $kWh = 261,5 \times 22,8$ | 1337,68 | kWh |
| 4 | SFOC | Generator Specification | 195 | g/kWh |
| 5 | Additional Fuel Consumption (ton) Fuel Consumption = Energy Consumption x $SFOC \times 10^{-6}$ | Fuel Consumption = $5962,2 \times 189 \times 10^{-6}$ | 0,26 | ton |
| 6 | HSD Fuel Price | Pertamina | 9700,00 | IDR/l |
| 7 | Fuel Consumption Cost $Cost = ((\text{Fuel Consumption} \times 1000)/0,85) \times \text{fuel price}$ | $Cost = ((0,26 \times 1000)/0,85) \times 9700$ | 2.976.725 | Rupiah |

4.24.3 Cost Estimation (Open Loop)

Table 4.32 Cost Estimation (Open Loop)

| Operational Cost | | | | | | |
|------------------|------------------|---|----------|--------|---------------|-------------------------|
| No. | Price Type | Specification | Quantity | Unit | Price/Unit | Total Price |
| 1 | Fuel Consumption | $((0,26 \text{ ton} \times 1000)/0,85) \times 9700$ | 34 | Voyage | Rp 2.976.725 | Rp101.208.642,55 |
| 2 | NaOH | No NaOH Required | 0 | Voyage | Rp 31.586.800 | - |
| 3 | Fresh Water | Generated by F.W Generator | 34 | Voyage | - | - |
| | | | | | Total | Rp101.208.642,55 |

4.24.4 Cost Estimation (Closed Loop)

Table 4.33 Cost Estimation (Closed Loop)

| Operational Cost | | | | | | |
|------------------|-----------------------------|---|----------|--------|---------------|---------------------------|
| No. | Price Type | Specification | Quantity | Unit | Price/Unit | Total Price |
| 1 | Additional Fuel Consumption | $((0,26 \times 1000)/0,85) \times 9700$ | 34 | Voyage | Rp 2.976.725 | Rp101.208.642,55 |
| 2 | NaOH | 5,8 m ³ | 34 | Voyage | Rp 31.586.800 | Rp1.073.951.200,00 |
| 3 | Fresh Water | Generated by F.W Generator | 34 | Voyage | - | - |
| Total | | | | | | Rp1.175.159.842,55 |

In those Table, we know if Cost estimated for open loop at 101 Million Rupiah and for Closed loop is estimated at 1,175 Billion Rupiah. So, it has a difference about IDR 1,073 Billion Rupiah per year. And this have a difference about 1061,1%

4.24.5 Operational Expenditure (Open Loop)

Table 4.34 Operational Expenditure (Open Loop)

| Operation Cost per Year | | | |
|-------------------------|---------------------------|--------------------------|----------------------------|
| No. | Item | Estimation | Total Cost |
| 1 | Maintenance & Repair Cost | 15% of Installation Cost | Rp 464.461.892 |
| 2 | Maintenance of Equipment | 5% of Equipment Cost | Rp 505.811.878 |
| 3 | Operational Cost | Described at 4.24.3 | Rp 101.208.643 |
| Total | | | Rp 1.071.482.412,21 |

4.24.6 Operational Expenditure (Closed Loop)

Table 4.35 Operational Expenditure (Closed Loop)

| Operation Cost per Year | | | |
|-------------------------|---------------------------|--------------------------|----------------------------|
| No. | Item | Estimation | Total Cost |
| 1 | Maintenance & Repair Cost | 15% of Installation Cost | Rp 464.461.892 |
| 2 | Maintenance of Equipment | 5% of Equipment Cost | Rp 505.811.878 |
| 3 | Operational Cost | Described at 4.24.4 | Rp 1.175.159.843 |
| Total | | | Rp 2.145.433.612,21 |

At another case, they have same difference, but at 100,23% per year.

CHAPTER 5

CONCLUSION

5.1 Conclusions

So, we can conclude this research, and the research results are:

- Scrubber System is divided into 3 kinds, such as Open Loop, Closed Loop, and Hybrid Loop
- Hybrid loop is a combination between open loop and closed loop so the operators can choose between open loop and closed loop, so the operators can not worried if the ship is on Zero Discharge areas as ruled on IMO 2020 Annex VI but with cheaper operation price outside Zero Discharge Area.
- If we assumed Main engine and boilers on this ship using HFO but generators is using HSD, the predicted cost as at IDR 7,18 Billion per trip, and increase just a little bit if Generators and Boilers using MDO. If Main Engine and Boilers using MDO, the predicted cost will be IDR 9,34 Billion per trip using Pertamina Price which is 9550 IDR per litre for MDO and 7000 IDR per litre for HFO and 9700 IDR per litre for HSD, resulting with a price difference at 30,05%
- The total of required powers are now increasing about 120,9 kW at Open Loop and 177,58 kW at Closed Loop
- The new total demand for this ship is 2341,9 kW
- For scrubber components, the cost of all components is 650143,80 USD or 10,116 Billion Rupiah(based on 24th April exchange rate which is IDR 15560 per USD)
- For Scrubber attachment, the cost is predicted about 1,282 million Euro. Based on Hybrid Loop Scrubber Application cost based on Berqvist et al. Which is 3 million Euro, the price differences is predicted about 57%
- The estimated price for Cost estimation between Open Loop and Closed Loop have a price difference at IDR 1,073 Billion per year and estimated at 1061,1%. And for the operational expenditure, cost per year between Open Loop and Closed Loop is estimated at same value as Cost estimation per year but at 100,23% in difference
- Overall, The Scrubber system is also an effective way to face based on IMO Regulation Annex VI 2020, the installation take time about 18 days.

5.2 Suggestions

After designing, calculating, and designing system for this ship, here are the suggestions:

- To modify this system for this ship needs analysis on required dimension, so the attachment will be precisely attached
- Make sure the new load factor can endure by existing generator at ship.
- To analyse cost estimation, we need to know installation costs, indirect costs, direct costs, and operation cost each loop so we can compare them.

A. PELAYANAN UMUM

| | | 1.2 |
|-----|--|-----------------|
| | | <u>Thn 2019</u> |
| 1 | Periksa bebas gas per tangki | Rp. 577,000 |
| 2 | Pembuangan sampah kapal per hari | Rp. 241,000 |
| 3 | Pemadam kebakaran | |
| 3.1 | Penjaga kebakaran/orang/hari | Rp. 198,000 |
| 3.2 | Sambung & lepas 1x pelaksanaan | Rp. 241,000 |
| 3.3 | Sewa selang pemadam kebakaran/hari | Rp. 200,000 |
| 4 | Pelayanan air : | |
| 4.1 | Air tawar dari tongkang | Rp. 98,600 |
| 4.2 | Air tawar dari darat / kade | Rp. 83,300 |
| 4.3 | Pasang/lepas slang/pipa air satu kali sambungan | Rp. 241,000 |
| 5 | Pelayanan listrik : | |
| 5.1 | Disesuaikan dengan tarif PLN | |
| 5.2 | Penyambungan dan pelepasan kabel satu kali sambung dan lepas | Rp. 346,000 |
| 6 | Penjagaan Keamanan Selama kapal docking / floating | Rp. 384,000 |
| 7 | Pelayanan Telephon lokal | |
| a. | Sambung lepas kabel | Rp. - |
| b. | Tarif telephon | Rp. |
| 8 | Pelayanan Saluran Ventilasi | |
| a. | Sambung saluran | Rp. 698,000 |
| b. | Tarif penggunaan(day/unit) | Rp. 262800 |
| 9 | Peranca/m3, pemasangan di : | |
| a. | Luar ruangan | Rp. 31,200 |
| b. | Dalam ruangan | Rp. 50,400 |
| c. | Posisi tinggi | Rp. 64,800 |
| 10 | Pelayanan Derek | |
| a. | Derek apung (floating crane) | |
| 1) | Kapasitas s/d 50 ton/jam | Rp. 8,258,000 |
| 2) | Kapasitas s/d 200 ton/jam | Rp. 21,479,000 |
| 3) | Tidak termasuk biaya kapal tunda | |
| 4) | Penggunaan dihitung minimum 2 jam | |
| b. | Mobile Crane | |
| 1) | Kapasitas 10 ton/jam | Rp. 328,000 |
| 2) | Kapasitas 20 ton s/d 25 ton/jam | Rp. 644,000 |
| 3) | Kapasitas 50 ton s/d 75 ton/jam | Rp. 1,817,000 |
| 4) | Kapasitas 100 ton/jam | Rp. 2,724,000 |
| | Penggunaan dihitung minimum 8 jam (termasuk mob/demob) | |

11 **Jasa TUNDA dan PANDU**1 **Penundaan Kapal di daerah Perairan Galangan**

C BANGUNAN KAPAL

CI Pembersihan badan kapal :

| | | | | |
|----|-----------------------------|-----|--------|-----------------|
| 1 | Water jetting air tawar | Rp. | 27,700 | /M ² |
| 2 | Water jetting air laut | Rp. | 10,000 | /M ² |
| 3 | Spot blasting | Rp. | 82,300 | /M ² |
| 4 | Full Sand blasting | Rp. | 72,100 | /M ² |
| 5 | Sweep blasting | Rp. | 61,600 | /M ² |
| 6 | Scrapping | Rp. | 21,560 | /M ² |
| 7 | Wire brushing | Rp. | 41,100 | /M ² |
| 8 | Ultrasonic test | Rp. | 30,900 | /titik |
| 9 | Amplashing | Rp. | 45,200 | /M ² |
| 10 | Cuci air tawar pada lambung | Rp. | 15,990 | /M ² |
| 11 | Chipping | Rp. | 30,900 | /M ² |

Catatan :

- a. Pengerjaan dengan lembur dihitung tersendiri
 - b. Untuk ultrasonic minimum 100 titik
 - c. Gambar laporan bukaan kulit sebagai lampiran ultrasonic maksimal 6 lembar.
 - d. Penambahan gambar laporan bukaan kulit sebagai lampiran ultrasonic Rp. 440,000 / lembar
 - e. Pekerjaan di dalam ruangan menjadi 200%
 - f. Area Top Side, ditambah 10% dari tarip diatas
 - g. Untuk pekerjaan blasting, minimum keluasan 100 M²
 - h. Dikenakan penambahan tarip untuk :
 - h.1 Kondisi kapal sangat kotor
 - h.2 Pembersihan dengan chemical
 - h.3 Kondisi cat yang menyebabkan ekstra kerja, waktu
 - h.4 Korosi yang sangat parah
 - h.5 Penetapan pengecatan SPC, ditambah 50% dari tarip.
 - i. Dikenakan tarip ekstra untuk :
 - i.1 Pekerjaan dalam tangki menjadi 250%
 - i.2 Pekerjaan badan kapal bagian dalam (inside hull)
 - j. Untuk pekerjaan blasting, untuk Sa = 2,5 dihitung tersendiri
- C2 Pengecatan (cat owner supplied)**
- | | | | | |
|------------|-----------------------------|-------|--------|---------------------------------|
| 1. Lambung | 1.1 Pengecatan per lapis | : Rp. | 8,900 | M ² / layer |
| | 1.2 Pengecatan per Touch Up | : Rp. | 15,600 | M ² / layer touch up |
- Catatan : Untuk pengecatan dalam tangki menjadi 250%

Catatan :

- a. Tarip ini berlaku naik / turun dock di dalam jam kerja normal pada hari kerja, di luar jam kerja normal akan dikenakan tarip sesuai butir 8
 - b. Penedokan kurang dari 2 hari, dihitung dua hari. 1,2 x 1
 - c. Apabila selama docking perlu dilakukan penggeseran balok lunas, akan dikenakan biaya tambahan sebesar 100% dari tarip docking / undocking.
 - d. Apabila diperlukan pengaturan khusus balok lunas atau fasilitas darat lainnya akan dikenakan biaya tambahan.
 - e. Emergency docking dikenakan biaya ekstra.
 - f. Kapal type khusus (KRI, Ferry Roro, TD, Yacht, Barge, Kapal Kerja) dihitung tersendiri
 - g. Untuk kapal type khusus dikenakan index / dihitung tersendiri berdasarkan :
 - a. KRI, Ferry Roro, Yacht = index tambahan min. 150% tarip
 - b. Kapal dengan draft 4 Meter s/d 5 Meter, = index tambahan min. 200% tarip
 - c. Kapal dengan draft 5 Meter s/d 6 Meter, = index tambahan min. 500% tarip
 - h. Bongkar & pasang kembali Dock block dikenakan biaya :
 - a. Keel Block Rp. 650.000,-/buah
 - b. Side Block Rp. 520.000,-/buah 1,2ⁿ
 - c. Bottom Share Rp. 650.000,-/buah
- Catatan : Dock block khusus dikenakan tarip tersendiri
- i Docking Report diberikan maksimal 6 rangkap.
 - j Air Bag dihitung tersendiri
 - k Biaya sandar 50 % dari docking perhari

C3 Penggantian baru plat baja/plat lurus

| TEBAL PLAT | BIAYA DASAR |
|-------------------|----------------|
| s/d 1/4" / 6 mm | Rp. 34,200 /Kg |
| 8 mm s/d 12 mm | Rp. 32,600 /Kg |
| lebih besar 12 mm | Rp. 32,600 /Kg |

Catatan :

- 1 a. Penggantian plat baja (mild steel) menurut jumlah :
 - s/d - 50 kg = 200%
 - s/d 51 - 100 kg = 175%
 - s/d 101 - 500 kg = 150%
 Material dari galangan
- b. High Tensile Steel, Grade plate type D&E dikenakan tarip ekstra
- c. Doubling plate, tarip ditambah 75% dari tarip replating (minimal 10 kg/pieces)
- d. Plat dengan dimensi khusus (trapesium) dihitung berdasarkan dimensi terbesar.
- e. Berlaku untuk plat (marine use) dengan standar BKI
- f. Bila berat replate atau doubling kurang dari 50 kg, maka dihitung 50 kg
- g. Asumsi harga plat di pasaran Rp. 10.000/ kg. Apabila terjadi perubahan dari asumsi tersebut tarip akan disesuaikan.
- h. Apabila material plat disuplai oleh owner maka harga jasa sebesar 65% dari tarif.
- i. Belum termasuk perancah
- j. Belum termasuk test kekedapan

2 Penggantian plat menurut lokasi :

| LOKASI : | % |
|--|-----|
| a. Side shell | 100 |
| b. Bottom | 110 |
| c. Keel plates | 115 |
| d. Deck plates | 100 |
| e. Tank tops | 110 |
| f. Engine room (side shell and deck) | 150 |
| g. Bulkhead | 120 |
| h. Fore and aft peak keel plate | 140 |
| i. Internals in DBT | 250 |
| j. Internals in room and casings | 120 |
| k. Mixed frame | 140 |
| l. Internal in aft and fore peak | 140 |
| m. Fore and aft stem (linggi haluan dan buritan) | 200 |
| n. Bulbous Bow | 300 |
| o. Internal Engine room & propulsion system (bottom) | 300 |

F SISTIM MINYAK
