### **Abstrak**

*Jalur By Pass adalah salah satu alternatif untuk mengatasi kemacetan lalu lintas yang terjadi. Salah satunya adalah By Pass Mojokerto, yang termasuk dalam kategori jalur Arteri Primer yang dilewati baik kendaraan antar Kabupaten maupun antar Propinsi. Jalur ini banyak diminati oleh masyarakat, karena lebih lancar untuk menghindari kemacetan yang terjadi di dalam kota. Oleh karena itu aktifitas arus lalu lintas yang terjadi pada jalur ini semakin lama semakin meningkat. Tugas akhir ini bertujuan untuk mengevaluasi kinerja jalur tersebut melalui analisa Kapasitas, Derajat Kejenuhan, lama waktu tempuhnya dan juga besar biaya operasi kendaraan serta memberikan alternatif penyelesaian untuk mendapatkan kapasitas dan nilai derajat kejenuhan yang memenuhi syarat.*

*Analisa yang dilakukan untuk mendapatkan kinerja by pass mojokerto ini menggunakan Program KAJI (Kapasitas Jalan Indonesia). Dalam mendapatkan data primer volume lalulintas atau data saat ini menggunakan cara traffic counting dan survey travel time, sedangkan untuk data sekunder yang nantinya digunakan untuk meramalkan pertumbuhan lalu lintas di masa mendatang diperoleh dari Dinas Pekerjaan Umum Bina Marga Propinsi Jawa Timur.*

*Berdasarkan analisa yang dilakukan dengan menggunakan data yang ada, didapatkan waktu tempuh hasil perhitungan arah Surabaya jalur by pass 457 detik dan jalur kota*

*sebesar 802 detik, arah jombang jalur by pass 457 detik dan jalur kota 817 detik. Sedangkan menurut pengamatan langsung didapat waktu tempuh arah Surabaya jalur by pass 855 detik dan jalur kota 1017 detik, lalu untuk arah Jombang jalur bypass 842 detik dan jalur kota 1012 detik. Dari hasil forecasting pada tahun 2014 kemudian dimasukkan kedalam program KAJI didapat hasil DS untuk arah Surabaya sebesar 1,051 dan untuk arah Jombang sebesar 1,292. Alternative yang diberikan adalah mengubah tipe jalan dari 2/2 UD dengan lebar 9 meter menjadi 4/2 D lebar 12 meter, yang bisa memperbaiki nilai DS jalur bypass menjadi 0,627 untuk arah Surabaya dan 0,642 untuk arah Jombang. Nilai BOK dan nilai waktu yang didapatkan dari hasil survey data dan perhitungan yang ada adalah untuk jalur By pass Arah Surabaya Golongan 1 Rp Rp 17,166, Golongan 2A Rp 31,036, dan Golongan 2B Rp 58,411. Jalur By pass Arah Jombang Golongan 1 Rp 17,121, Golongan 2A Rp 31,020, dan Golongan 2B Rp 58,357. Jalur Dalam Kota Arah Surabaya Golongan 1 Rp 20,884, Golongan 2A Rp 35,456, dan Golongan 2B Rp 66,891. Jalur Dalam Kota Arah Jombang Golongan 1 Rp 20,887, Golongan 2A Rp 35,381, dan Golongan 2B Rp 66,687.*

## **Abstract**

*By Pass path is an alternative to overcome the traffic congestion that occurs. One is Mojokerto By Pass, which is included in the category path Arteri Primer good vehicle that passed between the District and among the Province. This path sought by many people, because it is smooth to avoid the bottleneck that occurred in the city. Therefore, the traffic flow of activity going on this path the longer growing. This final task was to evaluate the performance of path through the analysis of capacity, Degree of Saturation, tempuhnya long time and also the cost of operating the vehicle and provides an alternative solution to get the capacity and the value of saturation degree are eligible.*

*Analysis conducted for the performance by using this pass mojokerto Program Kaji (Capacity Jalan Indonesia). Get in the primary data volume or data lalulintas at this time use surveys and traffic counting travel time, while for the secondary data used unutk predict future traffic growth in the future from the Department of Public Works Bina Marga Propinsi Jawa Timur.*

*Based on the analysis performed using existing data, the results obtained when the calculation of the direction of Surabaya routes by pass 457 seconds and city route about 802 seconds, the direction of Jombang lines by pass 457 seconds and city route 817 seconds. The direct observation of the obtained time-Surabaya route direction by pass 855 seconds and city route 1017*

seconds, and for the direction of Jombang bypass path 842 seconds and city route in 1012 seconds. From the results of the forecasting in 2014 and then entered into the program KAJi, DS obtained results for the direction of Surabaya is 1.051 and 1.292 of Jombang direction. Given alternative is to change the type of road from 2 / 2 UD 9 meters wide with a 4 / 2 D width of 12 meters, which can improve the value of DS bypass lane for the Surabaya direction to be 0.627 and 0.642 for Jombang direction Jombang. BOK value and time value obtained from the survey data and calculation of the by pass path Surabaya direction Group 1 = Rp 17,166, Group 2A = Rp 31,036, Group 2B = Rp 58,411. While for jombang direction Group 1 = Rp 17,121, Group 2A = Rp 31,020, Group 2B = Rp 58,357. While the path to the city for Surabaya direction is Group 1 = Rp 20,884, Group 2A = Rp 35,456, Group 2B = Rp 66,89. And for jombang direction Group 1 = Rp 20,887, Group 2A = Rp 35,381, Group 2B = Rp 66,687

### **Keywords: Performance, Bok, Forecasting, Travel Time**

The research was conducted to analyze the relationship between the characteristics of the road network and the traffic flow. The analysis was conducted by using the KAJi software to predict the traffic flow in the future. The results of the analysis showed that the traffic flow in the future will increase significantly. This is due to the increasing number of vehicles on the road network. The analysis also showed that the traffic flow in the future will be affected by the characteristics of the road network. The characteristics of the road network include the type of road, the width of the road, the number of lanes, the presence of traffic lights, and the presence of pedestrian crossings. The analysis also showed that the traffic flow in the future will be affected by the characteristics of the road network. The characteristics of the road network include the type of road, the width of the road, the number of lanes, the presence of traffic lights, and the presence of pedestrian crossings.

## KATA PENGANTAR

Puji syukur kepada Tuhan Yang Maha Esa yang telah memampukan dan membimbing kami sehingga dapat menyelesaikan Tugas Akhir berjudul “Studi Kinerja Jalur By Pass Mojokerto Dibandingkan Dengan Jalur Dalam Kota”. Pada kesempatan ini saya ingin mengucapkan terima kasih kepada pihak-pihak yang telah membantu dalam penyelesaian Tugas Akhir ini, yaitu:

1. Orang tua yakni Ibu dan ayah dan segenap keluarga, mbakku dan juga adikku yang telah memberikan dukungan moral, spiritual dan material.
2. Ir. Wahju Herijanto, MT selaku dosen pembimbing dan dosen Konsultasi yang telah memberikan bimbingan dan motivasinya sehingga tugas akhir ini dapat diselesaikan dengan baik.
3. Ir. Sri Haryati selaku dosen wali yang selalu sabar memberikan saran serta dorongan selama kuliah di ITS.
4. Seluruh dosen dan karyawan Teknik Sipil ITS.
5. Kepada Nyambek, Domas, Per, Danny & Mimi, Mila yang cerewet, Nisa, Rizal (seperjuangan kost), Aril & Rafid(ojo NgeTruf ae yo), sobat kerabat ekspedisi, wes pokoke semua keluarga Angkatan Istimewa S-48, Terima Kasih atas semua dukungan, bantuan dan kenangan yang telah diberikan.
6. Kepada Dedik, Bondan, dan semua yang telah membantu saya untuk survey lapangan.
7. “Seorang anak manusia” yang telah memberikan semangat lebih pada Penulis khususnya diakhir masa penulisan tugas akhir ini.
8. Boss CECC Teknik Sipil ITS yang telah memberikan kami tempat bernaung yang nyaman serta semua penghuni CECC cewek cowok matur suwun,.
9. Mas Bas, Pak Tiyok, Pak So, dan Ibu kantin matur suwun wes oleh ngutang.

10. Ara S50 yang telah membantu menerjemahkan abstrakku juga seluruh pihak yang belum bisa saya sebutkan satu per satu yang selalu membantu kelancaran penulisan tugas akhir ini.

Saya menyadari bahwa masih terdapat kekurangan pada penyusunan Tugas Akhir ini. Oleh karena itu, saran dan kritik pembaca akan sangat bermanfaat sebagai masukan dan perbaikan untuk penyusunan laporan berikutnya. Namun demikian, saya berharap semoga isi Tugas Akhir ini bisa memberikan manfaat bagi saya dan pembaca.

Akhir kata, saya ucapkan terima kasih kepada pembaca atas perhatian dan kesediaannya meluangkan waktu untuk membaca Tugas akhir ini.

Surabaya, 4 Agustus 2009

Penulis

## BAB 1

### PENDAHULUAN

#### 1.1 LATAR BELAKANG

Jalur By Pass adalah salah satu alternatif untuk mengatasi kemacetan lalu lintas yang terjadi. Salah satu kota di Jawa Timur, Mojokerto, juga memiliki jalur By Pass ini. Jalur ini dulunya adalah merupakan jalan Tol Mojokerto. Yang digunakan untuk mengalihkan arus kendaraan agar tidak melalui jalur dalam kota sehingga bisa mengurangi kemacetan yang ada di dalam kota. Namun sejak tahun 2000 Pihak Jasa Marga telah membebaskan Tol tersebut. Sehingga sekarang semua jenis kendaraan baik motorized vehicle maupun unmotorized vehicle bisa melalui jalur ini. Jalur ini sangat penting perannya dalam jaringan jalan di Jawa Timur. Karena termasuk kategori Jalur Arteri Primer yang dilewati baik kendaraan antar kabupaten maupun antar propinsi.

By Pass Mojokerto ini banyak diminati oleh masyarakat, karena lebih lancar untuk menghindari kemacetan yang terjadi di dalam kota. Oleh karena itu aktifitas arus lalu lintas yang terjadi pada jalur ini semakin lama semakin meningkat. Peningkatan aktivitas lalu lintas ini tidak diimbangi dengan peningkatan kinerja jalan yang ada. Sehingga dalam kenyataannya sekarang ini sering terjadi kemacetan pada jalur yang seharusnya bebas dari macet. Akhirnya tidak sedikit masyarakat yang mulai meninggalkan bypass dan kembali melalui jalur dalam kota. Apalagi persentase kendaraan yang tidak melalui jalur by pass sebesar 30%-35%. Hal ini akan menambah kepadatan dijalur kota, karena jalur yang tak mengalami perbaikan kinerja, misal pelebaran jalan, tidak mampu menerima tambahan volume lalulintas lagi.

Tugas akhir ini dimaksudkan untuk mengevaluasi kinerja jalan by pass Mojokerto tersebut dengan memperhatikan faktor kapasitas, travel time, derajat kejenuhannya serta meninjau besarnya biaya operasional kendaraan dan nilai waktu yang dikeluarkan jika melalui jalur bypass dan jalur dalam kota. Untuk persimpangan yang paling berpengaruh pada arus lalu lintas ini adalah persimpangan Jayanegara yang terletak di sebelah terminal Kertajaya Mojokerto. Karena Persimpangan ini menghubungkan Mojokerto bagian timur (Mojosari) dan bagian barat Mojokerto (Kota). Dari hasil study kinerja ini, Jalur By pass akan dibandingkan dengan Kinerja salah satu jalur dalam kota ditinjau dari travel time serta biaya perjalanananya. Akhirnya bisa diperoleh hasil analisa kinerja bypass yang nantinya akan ditentukan beberapa alternatif untuk perbaikan kinerja jalur bypass Mojokerto.

## 1.2 RUMUSAN MASALAH

Rumusan Permasalahan yang diambil dalam penyusunan tugas akhir ini melengkapi :

- a. Bagaimakah Kinerja jalur bypass sekarang ini dibandingkan dengan jalur dalam kota dilihat dari travel time perhitungan dan travel time pengamatan pada saat jam sibuk?
- b. Berapakah besaran biaya operasional kendaraan serta nilai waktu pada jalur by pass dengan jalur dalam kota tiap golongan kendaraannya?
- c. Bagaimana tingkat pertumbuhan lalu lintas pada 5 tahun kedepan di jalur By pass serta kinerjanya?
- d. Bagaimana alternatif perbaikan untuk meningkatkan kinerja jalur bypass Mojokerto ini?

## 1.3 TUJUAN

Adapun tujuan pada penyusunan tugas akhir ini adalah :

- a. Menganalisa dan membandingkan tingkat kinerja yang terjadi antara Jalur By pass dan Jalur dalam kota dilihat dari travel time secara perhitungan dan secara pengamatan langsung.
- b. Menganalisa dan membandingkan besarnya biaya operasional kendaraan dan nilai waktu yang dikeluarkan jika melalui jalur bypass dan jalur dalam kota tiap golongan kendaraannya.
- c. Meramalkan tingkat pertumbuhan pergerakan lalu lintas yang terjadi pada jalur by pass dalam umur rencana 5 tahun kedepan guna mencari kinerja bypass dimasa yang akan datang.
- d. Mendapatkan alternatif yang terbaik untuk meningkatkan kinerja Bypass Mojokerto.

#### 1.4 BATASAN MASALAH

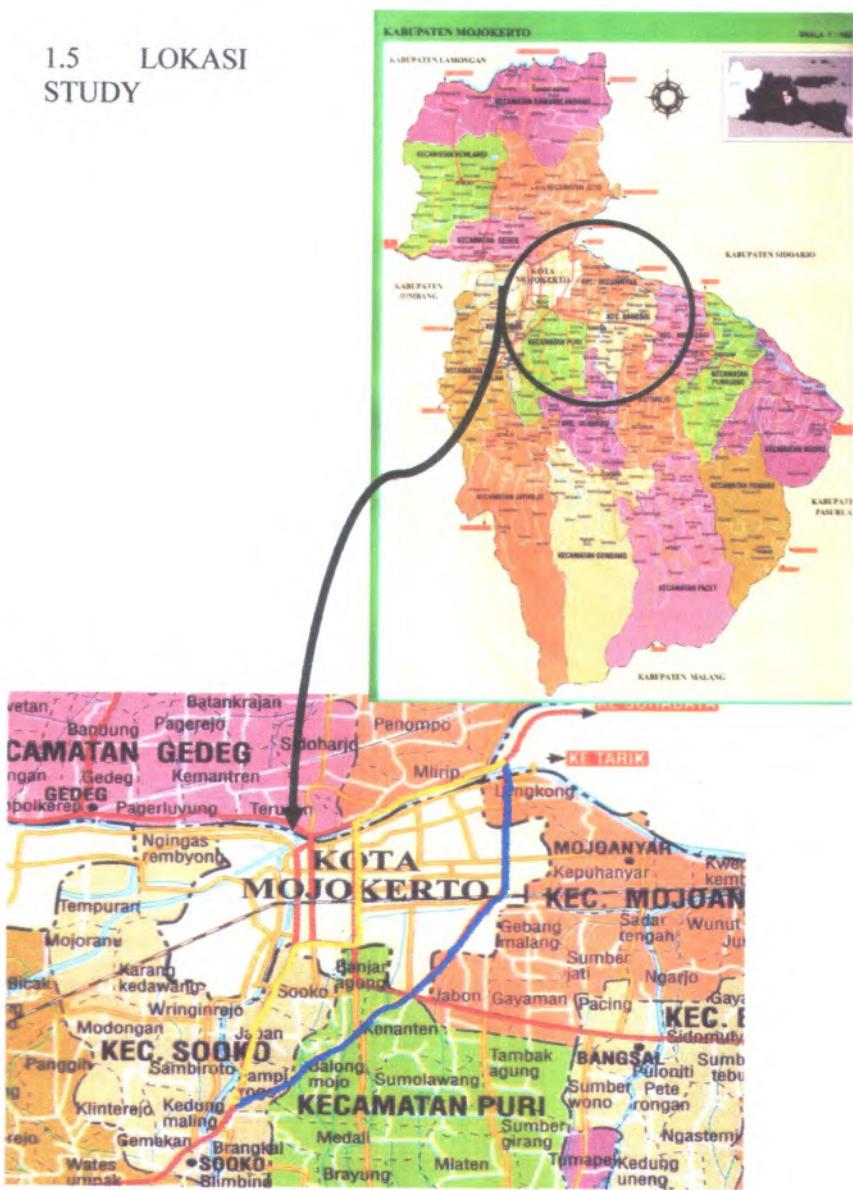

Batasan masalah yang dipakai dalam penyusunan tugas akhir ini adalah sebagai berikut:

- a. Perbandingan yang dilakukan hanya ditinjau dari nilai Travel time, biaya operasional kendaraan, serta nilai waktu.
- b. Segmen jalan yang ditinjau pada bypass Mojokerto yaitu mulai dari eks pintu masuk Tol Mojokerto (0+000 km) desa Mlirip sampai dengan Pertigaan Sooko (10 + 000 km) desa jampirogo.
- c. Segmen bypass dibagi menjadi 3 ruas, mlirip-pemandian, pemandian-terminal, dan terminal-jampirogo.
- d. Segmen jalan dalam kota yang digunakan untuk pembanding adalah eks. Pintu Tol – Jl. Mlirip – Jl. Gajah Mada – Jl. Pahlawan – Jl. Raden Wijaya – Jl. RA. Basuni dengan jarak tempuh 11,5 km.

- e. Segmen jalan dalam kota dibagi menjadi 7 ruas, mlirip-jambatan gajah mada, Jembatan gajah mada-perempatan empunala, perempatan empunala-perempatan benteng pancasila, perempatan benteng pancasila-Perempatan Puri, Perempatan Puri - Pertigaan Brawijaya, Pertigaan Brawijaya-perempatan sooko, perempatan sooko-Jampirogo.
- f. Analisa lalu lintas berdasarkan data volume lalu lintas dari Dinas Perhubungan dan Dinas PU Bina Marga mulai dari tahun 2004 sampai dengan tahun 2008.
- g. Peramalan hanya dilakukan pada jalur by pass Mojokerto dengan asumsi tidak terjadi perubahan sistem jaringan jalan dan kondisi eksisting by pass tetap selama umur rencana.
- h. Pada persimpangan yang ada pada jalur bypass ini hanya memperhatikan panjang delaynya tanpa memperhatikan persinyalannya.
- i. Analisa Kinerja Ruas jalan ini menggunakan program bantu KAJI.
- j. Pada perhitungan BOK menggunakan formula jasa marga dan jenis kendaraan dibagi menjadi 3 golongan yaitu Golongan 1, Golongan 2A dan Golongan 2B.
- k. Pada tugas akhir ini tidak diberikan alternative lain misal flyover atau pengaturan lampu lalu lintas dalam hal perbaikan kinerja, karena pada tahun 2004 perempatan terminal kertajaya telah diambil sebagai judul TA.

## BAB II

### TINJAUAN PUSTAKA

#### 2.1. KARAKTERISTIK JALAN LUAR KOTA

Dalam analisa kinerja jalan luar kota, digunakan 3 macam karakteristik yaitu karakteristik lalu lintas, karakteristik geometri jalan dan karakteristik lingkungan.

##### 2.1.1. KARAKTERISTIK LALU LINTAS

Didalam karakteristik lalu lintas terdapat komposisi lalu lintas, pemisahan arah lalu lintas, dan hambatan samping.

- Komposisi lalu lintas

Komposisi lalu-lintas mempengaruhi hubungan kecepatan-arus jika arus dan kapasitas dinyatakan dalam kend/jam, yaitu tergantung pada rasio sepeda motor atau kendaraan berat dalam arus lalu-lintas. Jika arus dan kapasitas dinyatakan dalam satuan mobil penumpang (smp), maka kecepatan kendaraan ringan dan kapasitas (smp/jam) tidak dipengaruhi oleh komposisi lalu-lintas.

Untuk komposisi lalu lintas diperlukan data arus lalu lintas jam rencana menurut jenis kendaraan dan jurusan (arah) yang tersedia. Jenis kendaraan untuk jalan luar kota akan dijelaskan pada table 2.1 dibawah ini.

**Tabel 2.1 Jenis Kendaraan untuk analisa kinerja jalan luar kota**

| No | Simbol | Kendaraan        | Keterangan  |
|----|--------|------------------|---|
| 1  | LV     | KENDARAAN RINGAN | Kendaraan bermotor beroda empat, dengan dua gandar berjarak 2,0 - 3,0 m (termasuk kendaraan penumpang, oplet, mikro bis, pick-up dan truk kecil, sesuai sistem klasifikasi Bina Marga). |

Lanjutan Tabel 2.1

|          |            |                                 |  |
|----------|------------|---------------------------------|--|
| <b>2</b> | <b>MHV</b> | <b>KENDARAAN BERAT MENENGAH</b> | Kendaraan bermotor dengan dua gandar, dengan jarak 3,5 - 5,0 m (termasuk bis kecil, truk dua as dengan enam roda, sesuai sistem klasifikasi Bina Marga).   |
| <b>3</b> | <b>LT</b>  | <b>TRUK BESAR</b>               | Truk tiga gandar dan truk kombinasi dengan jarak gandar (gander pertama ke kedua) < 3,5 m (sesuai sistem klasifikasi Bina Marga).  |
| <b>4</b> | <b>LB</b>  | <b>BUS BESAR</b>                | Bis dengan dua atau tiga gandar dengan jarak as 5,0 - 6,0 m.   |
| <b>5</b> | <b>MC</b>  | <b>SEPEDA MOTOR</b>             | Sepeda motor dengan dua atau tiga roda (meliputi sepeda motor dan kendaraan roda tiga sesuai sistem klasifikasi Bina Marga).   |
| <b>6</b> | <b>UM</b>  | <b>KENDARAAN TAK BERMOTOR</b>   | Kendaraan ber tenaga manusia atau hewan di atas roda (meliputi sepeda, becak, kereta kuda dan kereta dorong sesuai sistem klasifikasi Bina Marga).<br>Catatan: Dalam manual ini kend. tak bermotor tidak dianggap sebagai unsur lalu-lintas tetapi sebagai unsur hambatan samping. |

Sumber : MKJI Hal 6-11

Didalam menganalisa kapasitas sebuah jalan, komposisi lalu lintas dalam kendaraan campuran dikonversi menjadi arus ekivalen dalam satuan mobil penumpang (smp). Semua nilai arus lalu-lintas (per arah dan total) dikonversikan menjadi satuan mobil penumpang (smp) dengan cara mengalikan dengan faktor ekivalensi mobil penumpang (emp) yang diturunkan secara empiris untuk tipe kendaraan berikut:

- Kendaraan ringan (meliputi mobil penumpang, minibus, truk pick-up dan jeep)
- Kendaraan berat menengah (meliputi truk dua gandar dan bus kecil)
- Bus besar
- Truk besar (meliputi truk tiga gandar dan truk gandengan)
- Sepeda motor

Pengaruh kehadiran kendaraan tak bermotor dimasukkan sebagai kejadian terpisah dalam faktor penyesuaian hambatan samping. Ekivalensi mobil penumpang (emp) untuk masing-masing tipe kendaraan tergantung pada tipe jalan, tipe alinyemen dan arus lalu-lintas total yang dinyatakan dalam kendaraan/jam.

Tabel 2.2 digunakan untuk menentukan emp untuk tipe jalan dua lajur-dua arah tak terbagi (2/2 UD), sedangkan table 2.3 digunakan untuk menentukan emp untuk tipe jalan empat lajur-dua arah terbagi (4/2 D) dan jalan empat lajur dua arah tak terbagi (4/2 UD).

**Tabel 2.2 Ekivalensi kendaraan penumpang (emp) untuk jalan 2/2 UD**

| Tipe alinyemen | Arus total (kend/jam) | emp |     |     |                            |     |      |

**Sumber : MKJI Hal 6-44**

- Pemisahan Arus Lalu Lintas

Pemisahan arus merupakan pembagian arah arus pada jalan yang dapat dinyatakan sebagai persentase dari arus total pada masing masing jalur (misalnya 60-40). Kapasitas jalan dua arah paling tinggi pada pemisahan arah 50 - 50, yaitu jika arus pada kedua arah adalah sama pada periode waktu yang dianalisa (umumnya satu jam). Untuk analisa kapasitas, pemisahan arah lalu lintas perlu diketahui untuk menentukan faktor penyesuaian kapasitas akibat pemisahan arah.

Tabel 2.4 dibawah ini memberikan faktor penyesuaian kapasitas akibat pemisahan arah (FC<sub>SP</sub>) untuk jalan dua lajur dua arah tak terbagi dan jalan empat-lajur dua-arah tak terbagi.

**Tabel 2.4 Faktor penyesuaian kapasitas akibat pemisahan arah ( FC<sub>SP</sub> )**

| Pemisahan arah SP %-% |                 | 50-50 | 55-45 | 60-40 | 65-35 | 70-30 |
|-----------------------|-----------------|-------|-------|-------|-------|-------|
| FCSPB                 | Dua-Lajur 2/2   | 1,00  | 0,97  | 0,94  | 0,91  | 0,88  |
|                       | Empat-Lajur 4/2 | 1,00  | 0,975 | 0,95  | 0,925 | 0,90  |

**Sumber : MKJI Hal 6-67**

- Hambatan Samping

Banyaknya kegiatan di samping jalan di Indonesia sering menimbulkan konflik, kadang kala berat, dengan arus lalu-lintas. Hambatan samping yang telah terbukti sangat berpengaruh pada kapasitas dan kinerja jalan luar kota adalah:

- Pejalan kaki;
- Pemberhentian angkutan umum dan kendaraan lain;
- Kendaraan lambat (misal becak, kereta kuda);
- Kendaraan masuk dan keluar dari lahan di samping jalan

Hambatan samping adalah pengaruh kegiatan di samping ruas jalan terhadap kinerja lalulintas, misalnya pejalan kaki (bobot 0,6) penghentian kendaraan umum atau kendaraan lainnya (bobot = 0,8), kendaraan masuk dan keluar lahan di samping jalan (bobot = 1,0) dan kendaraan lambat (bobot = 0,4).

Kelas hambatan samping ditentukan berdasarkan Frekuensi berbobot dan kejadian dikedua sisi jalan diperlihatkan pada table 2.5. Dan pada Tabel 2.6 akan diperlihatkan faktor penyesuaian akibat Hambatan samping ( $FC_{SF}$ ) untuk jalan empat lajur dua arah terbagi, jalan empat lajur dua arah tak terbagi dan jalan dua lajur dua arah tak terbagi.

**Tabel 2.5. Kelas Hambatan Samping**

| Kelas Hambatan Samping | Kode | Frekuensi Berbobot dan Kejadian (kedua sisi) | Kondisi Khas  |
|------------------------|------|--|---|
| Sangat Rendah          | VL   | <50  | Pedesaan pertanian atau belum berkembang              |
| Rendah                 | L    | 50-100                                       | Pedesaan beberapa bangunan dan kegiatan samping jalan |

**Lanjutan Tabel 2.5**

|               |    |         |   |
|---------------|----|---------|---|
| Sedang        | M  | 150-250 | Kampung: Kegiatan Pemukiman                   |
| Tinggi        | H  | 250-350 | Kampung : beberapa kegiatan pasar             |
| Sangat Tinggi | VH | >350    | Hampir perkotaan: banyak pasar/kegiatan niaga |

### 2.1.2. KARAKTERISTIK GEOMETRIK JALAN

Karakteristik geometri jalan meliputi antara lain : lebar jalur lalu lintas, karakteristik bahu, ada atau tidaknya median, jarak pandang.

- **Lebar Jalur Lalu Lintas**

kapasitas meningkat dengan bertambahnya lebar jalur lalu-lintas. Tabel 2.7 berikut memberikan faktor penyesuaian kapasitas akibat lebar jalur lalu lintas. ( $FC_w$ ) untuk jalan empat lajur dan jalan enam lajur terbagi, jalan empat lajur tak terbagi serta jalan dua lajur tak terbagi.

**Tabel 2.7. Faktor penyesuaian kapasitas akibat lebar jalur lalu lintas ( $FC_w$ )**

| Tipe jalan              | Lebar efektif jalur lalu-lintas<br>( $W_c$ )<br>(m) | $FC_w$ |
|-------------------------|---|--------|
| Empat-lajur terbagi     | Per lajur<br>3.0                                    | 0,91   |
|                         | 3.25  | 0,96   |
|                         | 3.50  | 1,00   |
|                         | 3.75  | 1,03   |
|                         | Per lajur<br>3.00                                   | 0,91   |
| Empat-lajur tak terbagi | 3.25  | 0,96   |
|                         | 3.50  | 1,00   |
|                         | 3.75  | 1,03   |
|                         | Total kedua arah<br>5                               | 0,69   |
|                         | 6   | 0,91   |
| Dua-lajur tak-terbagi   | 7   | 1,00   |
|                         | 8   | 1,08   |
|                         | 9   | 1,15   |
|                         | 10  | 1,21   |
|                         | 11  | 1,27   |
|                         |   |        |

Sumber : MKJI Hal 6-66

### - **Karakteristik Bahu**

Bahu jalan adalah bagian daerah manfaat jalan yang berdampingan dengan jalur lalu lintas untuk menampung kendaraan yang berhenti ataupun keperluan lainnya. Kapasitas, dan kecepatan pada arus tertentu, bertambah sedikit dengan bertambahnya lebar bahu. Kapasitas berkurang jika terdapat penghalang tetap dekat pada tepi jalur lalu-lintas. Lebar bahu perlu diketahui untuk menentukan faktor penyesuaian kapasitas akibat hambatan samping (lihat table 2.6)

### - **Ada atau Tidaknya Median (Kebebasan Samping)**

Median merupakan daerah yang memisahkan arah lalu lintas di jalan. Median jalan yang terlalu dekat dengan batas jalur berpengaruh terhadap arus lalu lintas, karena keadaan ini berarti berkurangnya lebar efektif jalur lalu lintas.

Ada atau tidaknya median berpengaruh terhadap penentuan tipe jalan dalam melakukan analisa kerja jalan. Ruas jalan yang memiliki median ditentukan sebagai tipe jalan terbagi, sedangkan yang tidak memiliki median ditentukan sebagai tipe jalan tak terbagi.

Median yang direncanakan dengan baik meningkatkan kapasitas. Tetapi mungkin ada alasan lain mengapa median tidak diinginkan, misalnya kekurangan tempat, biaya, jalan masuk ke prasarana samping jalan dsb.

### - **Jarak pandang**

Jarak pandang adalah jarak maksimum dimana pengemudi mampu melihat kendaraan lain atau suatu benda tetap pada ketinggian tertentu(1,3m). Apabila jarak pandangnya panjang, menyalip akan lebih mudah dan kecepatan serta kapasitas lebih tinggi. Meskipun sebagian tergantung pada lengkung vertikal dan horizontal, jarak pandang juga tergantung pada ada atau tidaknya penghalang

pandangan dari tumbuhan, pagar, bangunan dan lain-lain. Kelas jarak pandang ditentukan berdasarkan definisi tipe penampang melintang jalan yang digunakan dalam panduan Manual Kapasitas Jalan Indonesia, yang ditunjukkan dalam tabel 2.8.

**Tabel 2.8. Definisi tipe penampang melintang jalan yang digunakan dalam panduan MKJI.**

| Tipe<br>Jalan/<br>Kode | Kelas<br>jarak<br>pandang | Lebar<br>jalan<br>(m) | Lebar bahu (m) |            |            | Dalam |  |
|------------------------|---------------------------|-----------------------|----------------|------------|------------|-------|--|
|                        |                           |                       | Luar           |            |            |       |  |
|                        |                           |                       | Datar          | Perbukitan | Pegunungan |       |  |

### 2.1.3. KARAKTERISTIK LINGKUNGAN

Karakteristik lingkungan merupakan hal yang tidak dapat diabaikan pengaruhnya dalam menentukan kinerja sebuah jalan. Karakteristik ini meliputi 2 hal yaitu kelas jalan dan tata guna lahan.

#### - Kelas Jalan

Dalam kelas jalan terdapat dua jenis yaitu kelas fungsional jalan dan kelas administrative jalan. Kedua kelas tersebut mencerminkan jenis perjalanan yang terjadi pada ruas jalan. Kelas jalan berdasarkan fungsinya terbagi atas :

- Jalan Arteri : Jalan umum yang berfungsi melayani angkutan utama dengan ciri perjalanan jarak jauh, kecepatan rata-rata tinggi, dan jumlah jalan masuk dibatasi secara berdaya guna.
- Jalan Kolektor : Jalan umum yang berfungsi melayani angkutan pengumpul atau pembagi dengan ciri perjalanan jarak sedang, kecepatan rata-rata sedang, dan jumlah jalan masuk dibatasi.
- Jalan lokal : Jalan umum yang berfungsi melayani angkutan setempat dengan ciri perjalanan jarak dekat, kecepatan rata-rata rendah, dan jumlah jalan masuk tidak dibatasi.

Sedangkan kelas jalan berdasarkan wewenang/pengawasannya (kelas administratif jalan ) terbagi atas :

- Jalan Nasional : Merupakan Jalan arteri dan jalan kolektor dalam sistem jaringan jalan primer yang menghubungkan antar ibukota propinsi, dan jalan strategis nasional, serta jalan Tol.
- Jala Propinsi : Merupakan jalan kolektor dalam sistem jaringan jalan primer yang menghubungkan ibukota provinci dengan ibukota kabupaten/kota, atau antar ibukota kabupaten/kota, dan jalan strategis propinsi.
- Jalan Kabupaten: Merupakan jalan lokal yang menghubungkan ibukota kabupaten dan ibukota kecamatan, antar ibukota kecamatan, ibukota kabupaten dengan pusat kegiatan lokal, antarpusat kegiatan lokal serta jalan umum dalam sistem jaringan jalan sekunder dalam wilayah kabupaten, dan jalan strategis kabupaten.

#### **Tata guna lahan**

Guna lahan merupakan gambaran dari pengembangan lahan disepanjang jalan. Guna lahan ditentukan sebagai persentase dari segmen jalan dengan pengembangan tetap dalam bentuk bangunan.

### **2.2. KARAKTERISTIK JALAN PERKOTAAN**

Dalam analisa kinerja jalan perkotaan, digunakan 3 macam karakteristik yaitu karakteristik lalu lintas, karakteristik geometri jalan dan karakteristik lingkungan.

#### **2.2.1. KARAKTERISTIK LALU LINTAS**

Didalam karakteristik lalu lintas terdapat komposisi lalu lintas, pemisahan arah lalu lintas, dan hambatan samping.

- Komposisi lalu lintas

Komposisi lalu-lintas mempengaruhi hubungan kecepatan-arus jika arus dan kapasitas dinyatakan dalam kend/jam, yaitu tergantung pada rasio sepeda motor atau kendaraan berat dalam arus lalu-lintas. Jika arus dan kapasitas dinyatakan dalam satuan mobil penumpang (smp), maka kecepatan kendaraan ringan dan kapasitas (smp/jam) tidak dipengaruhi oleh komposisi lalu-lintas.

Untuk komposisi lalu lintas diperlukan data arus lalu lintas jam rencana menurut jenis kendaraan dan jurusan (arah) yang tersedia. Jenis kendaraan untuk jalan perkotaan akan dijelaskan pada table 2.9 dibawah ini.

**Tabel 2.9 Jenis Kendaraan untuk analisa kinerja jalan perkotaan**

| No | Simbol | Kendaraan        | Keterangan  |
|----|--------|------------------|---|
| 1  | LV     | KENDARAAN RINGAN | Kendaraan bermotor beroda empat, dengan dua gandar berjarak 2,0 - 3,0 m (termasuk kendaraan penumpang, oplet, mikro bis, pick-up dan truk kecil, sesuai sistem klasifikasi Bina Marga). |
| 3  | HV     | KENDARAAN BERAT  | Termasuk Truk dan Bus.  |
| 5  | MC     | SEPEDA MOTOR     | Sepeda motor dengan dua atau tiga roda (meliputi sepeda motor dan kendaraan roda tiga sesuai sistem   |

Lanjutan Tabel 2.9

|   |    |                        | klasifikasi Bina Marga).   |
|---|----|------------------------|--|
| 6 | UM | KENDARAAN TAK BERMOTOR | <p>Kendaraan bertenaga manusia atau hewan di atas roda (meliputi sepeda, becak, kereta kuda dan kereta dorong sesuai sistem klasifikasi Bipa Marga).</p> <p>Catatan: Dalam manual ini kend. tak bermotor tidak dianggap sebagai unsur lalu-lintas tetapi sebagai unsur hambatan samping.</p> |

Sumber : MKJI Hal 5-17

Didalam menganalisa kapasitas sebuah jalan, komposisi lalu lintas dalam kendaraan campuran dikonversi menjadi arus ekivalen dalam satuan mobil penumpang (smp). Semua nilai arus lalu-lintas (per arah dan total) dikonversikan menjadi satuan mobil penumpang (smp) dengan cara mengalikan dengan faktor ekivalensi mobil penumpang (emp) yang diturunkan secara empiris untuk tipe kendaraan berikut:

- Kendaraan ringan (meliputi mobil penumpang, minibus, truk pick-up dan jeep)
- Kendaraan berat (termasuk Truk dan Bus)
- Sepeda motor

Pengaruh kehadiran kendaraan tak bermotor dimasukkan sebagai kejadian terpisah dalam faktor penyesuaian hambatan samping. Ekivalensi mobil penumpang

(emp) untuk masing-masing tipe kendaraan tergantung pada tipe jalan, tipe alinyemen dan arus lalu-lintas total yang dinyatakan dalam kendaraan/jam.

Tabel 2.10 digunakan untuk menentukan emp untuk tipe jalan dua lajur-dua arah tak terbagi (2/2 UD), sedangkan tabel 2.11 digunakan untuk menentukan emp untuk tipe jalan empat lajur-dua arah terbagi (4/2 D) dan jalan empat lajur dua arah tak terbagi (4/2 UD).

**Tabel 2.10 Ekivalensi kendaraan penumpang (emp) untuk jalan tak terbagi**

| Tipe jalan :<br>Jalan tak terbagi   | Arus lalu-<br>lintas<br>total dua<br>arah<br><br>(kend/jam) | Emp |                                   |      |
|-------------------------------------|---|-----|-----------------------------------|------|
|                                     |   | HV  | MC                                |      |

|--|------------------|------------|--------------|

Sumber : MKJI Hal 5-38

- **Pemisahan arus lalu lintas**

Pemisahan arus merupakan pembagian arah arus pada jalan yang dapat dinyatakan sebagai persentase dari arus total pada masing-masing jalur (misalnya 60-40). Kapasitas jalan dua arah paling tinggi pada pemisahan arah 50 - 50, yaitu jika arus pada kedua arah adalah sama pada periode waktu yang dianalisa (umumnya satu jam). Untuk analisa kapasitas, pemisahan arah lalu lintas perlu diketahui untuk menentukan faktor penyesuaian kapasitas akibat pemisahan arah.

Tabel 2.12 dibawah ini memberikan faktor penyesuaian kapasitas akibat pemisahan arah (FC<sub>SP</sub>) untuk jalan dua lajur dua arah tak terbagi dan jalan empat-lajur dua-arah tak terbagi.

**Tabel 2.12 Faktor penyesuaian kapasitas akibat pemisahan arah (FC<sub>SP</sub>)**

| Pemisahan arah SP %-% |                 | 50-50 | 55-45 | 60-40 | 65-35 | 70-30 |
|-----------------------|-----------------|-------|-------|-------|-------|-------|
| FC <sub>SP</sub>      | Dua-lajur 2/2   | 1,00  | 0,97  | 0,94  | 0,91  | 0,88  |
|                       | Empat-lajur 4/2 | 1,00  | 0,985 | 0,97  | 0,955 | 0,94  |

Sumber : MKJI Hal 5-52

- **Hambatan Samping**

Banyaknya kegiatan di samping jalan di Indonesia sering menimbulkan konflik, kadang kala berat, dengan arus lalu-lintas. Hambatan samping yang telah terbukti sangat berpengaruh pada kapasitas dan kinerja jalan luar kota adalah:

- Pejalan kaki;
- Pemberhentian angkutan umum dan kendaraan lain;
- Kendaraan lambat (misal becak, kereta kuda);
- Kendaraan masuk dan keluar dari lahan di samping jalan

Hambatan samping adalah pengaruh kegiatan di samping ruas jalan terhadap kinerja lalulintas, misalnya pejalan kaki (bobot 0,5) penghentian kendaraan umum atau kendaraan lainnya (bobot = 1,0), kendaraan masuk dan keluar lahan di samping jalan (bobot = 0,7) dan kendaraan lambat (bobot = 0,4).

Kelas hambatan samping ditentukan berdasarkan Frekuensi berbobot dan kejadian dikedua sisi jalan diperlihatkan pada table 2.13. Dan pada Tabel 2.14 akan diperlihatkan faktor penyesuaian akibat Hmbatan samping ( $FC_{SF}$ ) untuk jalan empat lajur dua arah terbagi, jalan empat lajur dua arah tak terbagi dan jalan dua lajur dua arah tak terbagi dengan Bahu, dan Tabel 2.15 memperlihatkan faktor penyesuaian kapasitas untuk hambatan samping dengan kereb.

**Tabel 2.13. Kelas Hambatan Samping**

| Kelas Hambatan Samping (SFC) | Kode | Frekuensi Berbobot dan Kejadian per 200m per jam (dua sisi) | Kondisi Khusus                                |
|------------------------------|------|---|---|
| Sangat Rendah                | VL   | <100  | Daerah pemukiman: jalan samping tersedia      |
| Rendah                       | L    | 100-299   | Daerah pemukiman : beberapa angkutan umum dsb |
| Sedang                       | M    | 300-499   | Daerah industry : beberapa toko sisi jalan    |

## 2.2.2. KARAKTERISTIK GEOMETRIK JALAN

Karakteristik geometri jalan meliputi antara lain : lebar jalur lalu lintas, karakteristik bahu, ada atau tidaknya median, jarak pandang.

### - Lebar jalur lalu-lintas

Kapasitas meningkat dengan bertambahnya lebar jalur lalu-lintas. Tabel 2.16 berikut memberikan faktor penyesuaian kapasitas akibat lebar jalur lalu lintas. ( $FC_W$ ) untuk jalan

empat lajur dan jalan enam lajur terbagi, jalan empat lajur tak terbagi serta jalan dua lajur tak terbagi.

**Tabel 2.16. Faktor penyesuaian kapasitas akibat lebar jalur lalu lintas (FCW)**

| Tipe jalan                               | Lebar jalur lalu-lintas efektif (Wc) (m) | FCw  |
|--|--|------|
| Empat lajur terbagi atau jalan satu arah | Per lajur                                |      |
|  | 3,00                                     | 0,92 |
|  | 3,25                                     | 0,96 |
|  | 3,50                                     | 1,00 |
|  | 3,75                                     | 1,04 |
|  | 4,00                                     | 1,08 |
| Empat lajur tak terbagi                  | Per lajur                                |      |
|  | 3,00                                     | 0,91 |
|  | 3,25                                     | 0,95 |
|  | 3,50                                     | 1,00 |
|  | 3,75                                     | 1,05 |
|  | 4,00                                     | 1,09 |
| Dua Lajur tak terbagi                    | Total dua arah                           |      |
|  | 5  | 0,56 |
|  | 6  | 0,87 |

#### Karakteristik bahu

Jalan perkotaan tanpa kereb pada umumnya mempunyai bahu pada kedua jalur lalu lintasnya. Lebar dan kondisi permukaannya mempengaruhi penggunaan bahu, berupa penambahan kapasitas , dan kecepatan pada arus tertentu, akibat pertambahan lebar bahu terutama karena

pengurangan hambatan samping yang disebabkan kejadian disisi jalan seperti kendaraan angkutan umum berhenti, pejalan kaki dan sebagainya. Kapasitas, dan kecepatan pada arus tertentu, bertambah sedikit dengan bertambahnya lebar bahu. Kapasitas berkurang jika terdapat penghalang tetap dekat pada tepi jalur lalu-lintas. Lebar bahu perlu diketahui untuk menentukan faktor penyesuaian kapasitas akibat hambatan samping (lihat table 2.14)

- **Kereb**

Kereb sebagai batas antara jalur lalu-lintas dan trotoar berpengaruh terhadap dampak hambatan samping pada kapasitas dan kecepatan. Kapasitas jalan dengan kereb lebih kecil dari jalan dengan bahu. Selanjutnya kapasitas berkurang jika terdapat penghalang tetap dekat tepi jalur lalu-lintas, tergantung apakah jalan mempunyai kereb atau bahu.

- **Ada atau tidaknya median ( kebebasan samping )**

Median merupakan daerah yang memisahkan arah lalu lintas di jalan. Median jalan yang terlalu dekat dengan batas jalur berpengaruh terhadap arus lalu lintas, karena keadaan ini berarti berkurangnya lebar efektif jalur lalu lintas.

Ada atau tidaknya median berpengaruh terhadap penentuan tipe jalan dalam melakukan analisa kerja jalan. Ruas jalan yang memiliki median ditentukan sebagai tipe jalan terbagi, sedangkan yang tidak memiliki median ditentukan sebagai tipe jalan tak terbagi.

Median yang direncanakan dengan baik meningkatkan kapasitas. Tetapi mungkin ada alasan lain mengapa median tidak diinginkan, misalnya kekurangan tempat, biaya, jalan masuk ke prasarana samping jalan dsb.

- **Jarak pandang**

Jarak pandanga adalah jarak maksimum dimana pengemudi mampu melihat kendaraan lain atau suatu benda tetap pada ketinggian tertentu(1,3m). Apabila jarak

pandangnya panjang, menyalip akan lebih mudah dan kecepatan serta kapasitas lebih tinggi. Meskipun sebagian tergantung pada lengkung vertikal dan horisontal, jarak pandang juga tergantung pada ada atau tidaknya penghalang pandangan dari tumbuhan, pagar, bangunan dan lain-lain. Kelas jarak pandang ditentukan berdasarkan definisi tipe penampang melintang jalan yang digunakan dalam panduan Manual Kapasitas Jalan Indonesia, yang ditunjukkan dalam table 2.17.

**Tabel 2.17. Definisi tipe penampang melintang jalan yang digunakan dalam panduan MKJI.**

#### - **Ukuran Kota**

Ukuran Indonesia serta keanekaragaman dan tingkat perkembangan daerah perkotaan menunjukkan bahwa perilaku pengemudi dan populasi kendaraan adalah beraneka ragam. Karakteristik ini dimasukkan dalam perhitungan secara tidak langsung, melalui ukuran kota. Kota yang lebih kecil menunjukkan perilaku pengemudi yang kurang gesit dan kendaraan yang kurang modern, menyebabkan kapasitas dan kecepatan lebih rendah pada arus tertentu, jika dibandingkan dengan kota yang lebih besar.

Pada tabel 2.18 menunjukkan nilai normal untuk komposisi lalu lintas. Tabel 2.19 akan menunjukkan nilai dari faktor penyesuaian kapasitas untuk ukuran kota (FCcs).

**Tabel 2.18. Nilai Normal untuk Komposisi Lalu-lintas.**

| Nilai normal untuk komposisi lalu-lintas |      |     |     |
|--|------|-----|-----|
| Ukuran Kota                              | LV % | HV% | MC% |
| <0,1 Juta Penduduk                       | 45   | 10  | 45  |

### 2.1.3. KARAKTERISTIK LINGKUNGAN

Karakteristik lingkungan merupakan hal yang tidak dapat diabaikan pengaruhnya dalam menentukan kinerja sebuah jalan. Karakteristik ini meliputi 2 hal yaitu kelas jalan dan tata guna lahan.

#### - Kelas Jalan

Dalam kelas jalan terdapat dua jenis yaitu kelas fungsional jalan dan kelas administrative jalan. Kedua kelas tersebut mencerminkan jenis perjalanan yang terjadi pada ruas jalan. Kelas jalan berdasarkan fungsinya terbagi atas :

- Jalan Arteri : Jalan umum yang berfungsi melayani angkutan utama dengan ciri perjalanan jarak jauh, kecepatan rata-rata tinggi, dan jumlah jalan masuk dibatasi secara berdaya guna.
- Jalan Kolektor : Jalan umum yang berfungsi melayani angkutan pengumpul atau pembagi dengan ciri perjalanan jarak sedang, kecepatan rata-rata sedang, dan jumlah jalan masuk dibatasi.
- Jalan lokal : Jalan umum yang berfungsi melayani angkutan setempat dengan ciri

perjalanan jarak dekat, kecepatan rata-rata rendah, dan jumlah jalan masuk tidak dibatasi.

Sedangkan kelas jalan berdasarkan wewenang/pengawasannya (kelas administratif jalan ) terbagi atas :

- Jalan Nasional : Merupakan Jalan arteri dan jalan kolektor dalam sistem jaringan jalan primer yang menghubungkan antar ibukota propinsi, dan jalan strategis nasional, serta jalan Tol.
- Jala Propinsi : Merupakan jalan kolektor dalam sistem jaringan jalan primer yang menghubungkan ibukota provinci dengan ibukota kabupaten/kota, atau antar ibukota kabupaten/kota, dan jalan strategis propinsi.
- Jalan Kabupaten : Merupakan jalan lokal yang menghubungkan ibukota kabupaten dan ibukota kecamatan, antar ibukota kecamatan, ibukota kabupaten dengan pusat kegiatan lokal, antarpusat kegiatan lokal serta jalan umum dalam sistem jaringan jalan sekunder dalam wilayah kabupaten, dan jalan strategis kabupaten.

#### **Tata guna lahan**

Guna lahan merupakan gambaran dari pengembangan lahan disepanjang jalan. Guna lahan ditentukan sebagai persentase dari segmen jalan dengan pengembangan tetap dalam bentuk bangunan.

### **2.3. KINERJA JALAN LUAR KOTA**

Kinerja jalan merupakan ukuran kualitatif yang mencerminkan persepsi pengemudi tentang kualitas berkendaraan, dimana perilaku pengemudi dan populasi kendaraan merupakan dua faktor yang tidak dapat diabaikan dalam menentukan kinerja jalan. Ukuran-ukuran dari suatu kinerja ruas jalan ditinjau dari segi teknik lalu lintas meliputi kapasitas dan derajat kejemuhan.

### 2.3.1. KAPASITAS

Kapasitas didefinisikan sebagai arus maksimum yang dapat dipertahankan persatuan jam yang melewati suatu titik di jalan dalam kondisi yang ada. Untuk jalan dua-lajur dua-arah, kapasitas didefinisikan untuk arus dua-arah (kedua arah kombinasi), tetapi untuk jalan dengan banyak lajur, arus dipisahkan per arah perjalanan dan kapasitas didefinisikan per lajur.

Nilai kapasitas telah diamati melalui pengumpulan data lapangan sejauh memungkinkan. Oleh karena kurangnya lokasi yang arusnya mendekati kapasitas segmen jalan sendiri (sebagaimana ternyata dari kapasitas simpang sepanjang jalan), kapasitas juga telah diperkirakan secara teoritis dengan menganggap suatu hubungan matematik antara kerapatan, kecepatan dan arus. Kapasitas dinyatakan dalam satuan mobil penumpang (smp), dapat dilihat di bawah.

Persamaan dasar untuk penentuan kapasitas adalah sebagai berikut :

$$C = CO \times FCW \times FCSP \times FCSF$$

di mana:

$C$  = kapasitas (smp/jam)

$CO$  = kapasitas dasar (smp/jam)

$FCW$  = faktor penyesuaian lebar jalan

$FCSP$  = faktor penyesuaian pemisahan arah (hanya untuk jalan tak terbagi)

$FCSF$  = faktor penyesuaian hambatan samping dan bahu jalan

- **Kapasitas Dasar**

Kapasitas dasar adalah kapasitas suatu segmen jalan untuk suatu set kondisi yang ditentukan sebelumnya (seperti geometrik, pola arus lalu lintas, dan faktor lingkungan). Table

2.20 dibawah ini memperlihatkan kapasitas dasar untuk jalan luar kota dengan memperhatikan tipe jalan / tipe alinyemen.

**Tabel 2.20. Kapasitas dasar pada jalan luar kota.**

| Tipe jalan/<br>Tipe alinyemen                             | Kapasitas dasar<br>Total kedua arah<br>(smp/jam/lajur) |

- **Faktor Penyesuaian kapasitas akibat lebar jalur lalu lintas (  $FC_w$  )**

Faktor penyesuaian untuk kapasitas dasar akibat lebar jalur lalu lintas (  $FC_w$  ) ditunjukkan pada table 2.7 dengan memperhatikan tipe jalan dan lebar efektif jalur lalu lintas.

- **Faktor penyesuaian kapasitas akibat pemisahan arah (  $FC_{SP}$  )**

Faktor penyesuaian untuk kapasitas dasar akibat pemisahan arah ditunjukkan pada Tabel 2.4. dengan memperhatikan tipe jalan dan pemisahan arah SP(%-%).

Faktor penyesuaian akibat pemisahan arah yang ditunjukkan pada tabel 2.4 hanya diterapkan pada jalan tak terbagi, sedangkan pada jalan terbagi faktor penyesuaian akibat pemisahan arah adalah 1,0 (karena arus dihitung untuk masing-masing arah)

- **Faktor penyesuaian kapasitas akibat hambatan samping (FC<sub>SF</sub>)**

Faktor penyesuaian untuk kapasitas dasar akibat hambatan samping (FC<sub>SF</sub>) ditunjukkan pada tabel 2.6 dengan memperhatikan tipé jalan, kelas hambatan samping dan lebar bahu efektif (Ws).

### **2.3.2. Derajat Kejemuhan**

Derajat kejemuhan didefinisikan sebagai rasio arus terhadap kapasitas, digunakan sebagai faktor kunci dalam penentuan perilaku lalu-lintas pada suatu simpang dan juga segmen jalan. Nilai Derajat kejemuhan menunjukkan apakah segmen jalan akan mempunyai masalah kapasitas atau tidak.

$$\boxed{DS = Q/C}$$

DS : derajat kejemuhan, untuk jalan Luar kota  $\leq 0,75$

Derajat kejemuhan dihitung dengan menggunakan arus dan kapasitas yang dinyatakan dalam smp/jam. Derajat kejemuhan digunakan untuk analisa perilaku lalu-lintas berupa kecepatan. Suatu jalan dikatakan jemu apabila arus lalu lintas yang terjadi melebihi kapasitas sesungguhnya. Dengan kata lain ada dua faktor yang berpengaruh untuk menentukan nilai derajat kejemuhan yaitu : arus lalu lintas dan kapasitas. Nilai suatu derajat kejemuhan ditentukan dengan rumus diatas.

### **2.3.3. Kecepatan**

Manual menggunakan kecepatan tempuh sebagai ukuran utama kinerja segmen jalan, karena ini mudah

dimengerti dan diukur, dan merupakan masukan yang penting bagi biaya pemakai jalan dalam analisa ekonomi. Kecepatan tempuh didefinisikan dalam manual ini sebagai kecepatan rata-rata ruang dari kendaraan ringan sepanjang segmen jalan :

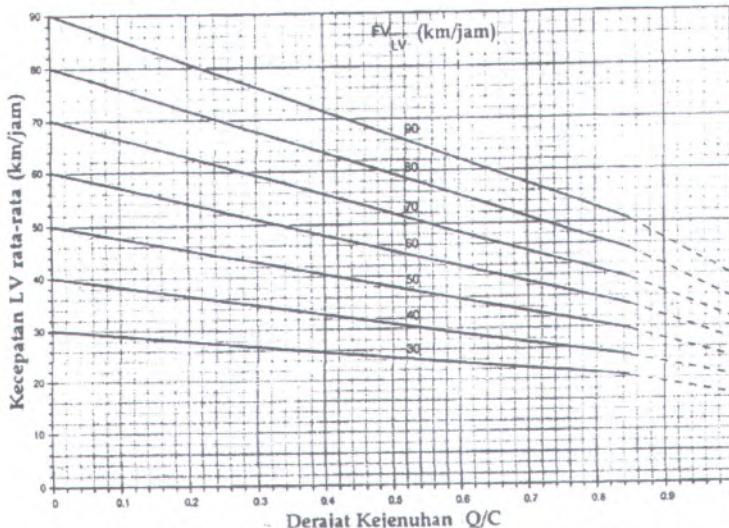

$$V = L/TT$$

di mana:

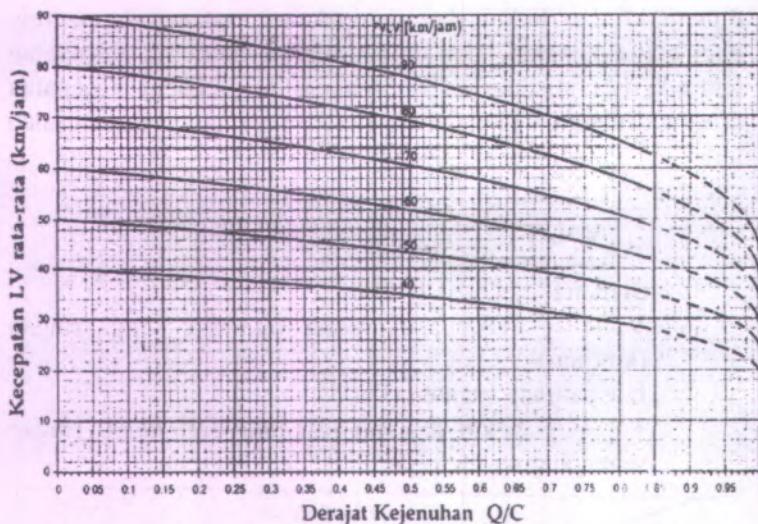

$V$  = kecepatan ruang rata-rata kend. ringan (km/jam)

$L$  = panjang segmen (km)

$TT$  = waktu tempuh rata-rata dari kend. ringan sepanjang segmen (jam)

**Gambar 2.1** Kecepatan sebagai fungsi dari derajat kejemuhan pada jalan 2/2 UD

**Gambar 2.2** Kecepatan sebagai fungsi dari derajat kejemuhan pada jalan empat-lajur

#### 2.4. KINERJA JALAN PERKOTAAN

Kinerja jalan merupakan ukuran kualitatif yang mencerminkan persepsi pengemudi tentang kualitas berkendaraan, dimana perilaku pengemudi dan populasi kendaraan merupakan dua faktor yang tidak dapat diabaikan dalam menentukan kinerja jalan. Ukuran-ukuran dari suatu kinerja ruas jalan ditinjau dari segi teknik lalu lintas meliputi kapasitas dan derajat kejemuhan.

##### 2.4.1. KAPASITAS

Kapasitas didefinisikan sebagai arus maksimum yang dapat dipertahankan persatuan jam yang melewati suatu titik di jalan dalam kondisi tertentu. Untuk jalan dua-lajur dua-arah, kapasitas ditentukan untuk arus dua-arah (kedua arah kombinasi), tetapi untuk jalan dengan banyak lajur, arus dipisahkan per arah perjalanan dan kapasitas ditentukan per lajur.

Nilai kapasitas telah diamati melalui pengumpulan data lapangan selama memungkinkan. Oleh karena kurangnya lokasi yang arusnya mendekati kapasitas segmen jalan sendiri (sebagaimana ternyata dari kapasitas simpang sepanjang jalan), kapasitas juga telah diperkirakan secara teoritis dengan menganggap suatu hubungan matematik antara kerapatan, kecepatan dan arus. Kapasitas dinyatakan dalam satuan mobil penumpang (smp), lihat di bawah. Persamaan dasar untuk penentuan kapasitas adalah sebagai berikut :

$$\boxed{C = CO \times FCW \times FCSP \times FCSF \times FCCS}$$

di mana:

C = kapasitas (smp/jam)

CO = kapasitas dasar (smp/jam)

FCW = faktor penyesuaian lebar jalan

FCSP = faktor penyesuaian pemisahan arah (hanya untuk jalan tak terbagi)

FCSF = faktor penyesuaian hambatan samping dan bahu jalan/kereb

FCCS = Faktor Penyesuaian ukuran kota.

- **Kapasitas Dasar**

Kapasitas dasar adalah kapasitas suatu segmen jalan untuk suatu kondisi geometri, pola arus lalu lintas dan faktor lingkungan yang ditentukan sebelumnya. Table 2.21 dibawah ini memperlihatkan kapasitas dasar untuk jalan perkotaan dengan memperhatikan tipe jalan / tipe alinyemen.

**Tabel 2.21. Kapasitas dasar pada jalan perkotaan.**

| Tipe jalan                                  | Kapasitas dasar<br>(smp/jam) | Catatan        |
|---|------------------------------|----------------|
| Empat-lajur terbagi atau<br>Jalan satu-arah | 1650                         | Per lajur      |
| Empat-lajur tak-terbagi                     | 1500                         | Per lajur      |
| Dua-lajur tak-terbagi                       | 2900                         | Total dua arah |

Sumber : MKJI Hal 6-65

- **Faktor Penyesuaian kapasitas akibat lebar jalur lalu lintas (  $FC_W$  )**

Faktor penyesuaian untuk kapasitas dasar akibat lebar jalur lalu lintas (  $FC_W$  ) ditunjukkan pada table 2.16 dengan memperhatikan tipe jalan dan lebar efektif jalur lalu lintas.

- **Faktor penyesuaian kapasitas akibat pemisahan arah (  $FC_{SP}$  )**

Faktor penyesuaian untuk kapasitas dasar akibat pemisahan arah ditunjukkan pada Tabel 2.12. dengan memperhatikan tipe jalan dan pemisahan arah SP(%-%). Faktor penyesuaian akibat pemisahan arah yang ditunjukkan pada tabel 2.12 hanya diterapkan pada jalan tak terbagi, sedangkan pada jalan terbagi faktor penyesuaian akibat pemisahan arah adalah 1,0 (karena arus dihitung untuk masing-masing arah)

- **Faktor penyesuaian kapasitas akibat hambatan samping (  $FC_{SF}$  )**

Faktor penyesuaian untuk kapasitas dasar akibat hambatan samping (  $FC_{SF}$  ) sebagai fungsi lebar bahu atau jarak kereb-penghalang ditunjukkan pada table 2.14 dan tabel 2.15 dengan memperhatikan tipe jalan, kelas hambatan samping dan lebar bahu efektif (  $W_s$  ) serta kereb.

- **Faktor penyesuaian kapasitas akibat ukuran kota (FC<sub>cs</sub>)**

Faktor penyesuaian untuk kapasitas dasar akibat ukuran kota. Faktor tersebut ditunjukkan pada tabel 2.19 dengan memperhatikan jumlah penduduk yang ada didalam kota yang ditinjau.

#### **2.4.2. Derajat Kejemuhan**

Derajat kejemuhan didefinisikan sebagai rasio arus terhadap kapasitas, digunakan sebagai faktor utama dalam penentuan tingkat kinerja pada suatu simpang dan juga segmen jalan. Nilai Derajat kejemuhan menunjukkan apakah segmen jalan akan mempunyai masalah kapasitas atau tidak.

$$\boxed{DS = Q/C}$$

DS : derajat kejemuhan

Derajat kejemuhan dihitung dengan menggunakan arus dan kapasitas yang dinyatakan dalam smp/jam. Derajat kejemuhan digunakan untuk analisa perilaku lalu-lintas berupa kecepatan. Suatu jalan dikatakan jemu apabila arus lalu lintas yang terjadi melebihi kapasitas sesungguhnya. Dengan kata lain ada dua faktor yang berpengaruh untuk menentukan nilai derajat kejemuhan yaitu : arus lalu lintas dan kapasitas. Nilai suatu derajat kejemuhan ditentukan dengan rumus diatas.

#### **2.4.3. Kecepatan**

Manual menggunakan kecepatan tempuh sebagai ukuran utama kinerja segmen jalan, karena mudah dimengerti dan diukur, dan merupakan masukan yang penting untuk biaya pemakai jalan dalam analisa ekonomi. Kecepatan tempuh didefinisikan dalam manual ini sebagai kecepatan rata-rata ruang dari kendaraan ringan (LV) sepanjang segmen jalan :

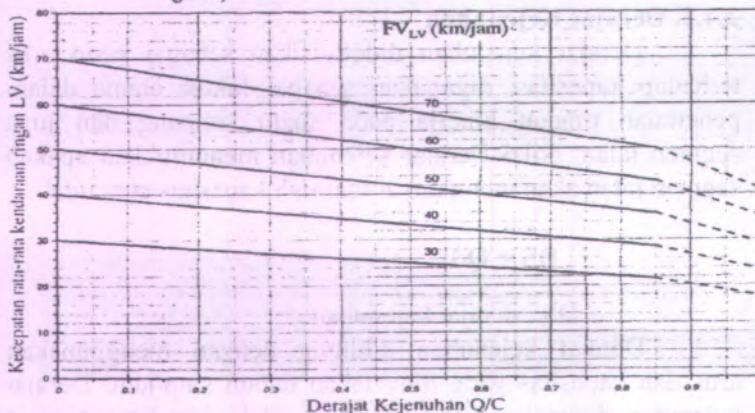

$$V = L/TT$$

dimana:

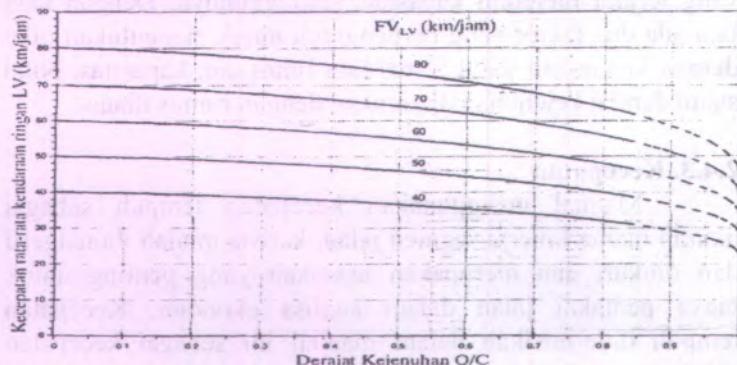

$V$  = Kecepatan rata-rata ruang LV (km/jam)

$L$  = Panjang segmen (km)

$TT$  = Waktu tempuh rata-rata LV sepanjang segmen (jam)

Gambar 2.3 Kecepatan sebagai fungsi dari DS untuk jalan 2/2 UD

Gambar 2.4 Kecepatan sebagai fungsi dari DS untuk jalan banyak-lajur dan satu-arah

## 2.5. WAKTU TEMPUH

Waktu tempuh adalah waktu total perjalanan yang diperlukan, termasuk berhenti dan tundaan, dari satu tempat ke tempat lain melalui rute tertentu. Waktu tempuh dapat diamati dengan cara Metode Pengamat bergerak, yaitu pengamat mengemudikan kendaraan survey di dalam arus lalu lintas dan mencatat waktu tempuhnya. Banyaknya sampel yang dibutuhkan dalam mencari waktu tempuh ini tergantung besarnya nilai koreksi akurasi yang diinginkan seperti pada tabel 2.22 dibawah ini.

**Tabel 2.22 Jumlah Sampel**

| Tipe Fasilitas           | Jumlah sampel sesuai dengan koreksi akurasi |     |
|--------------------------|---|-----|
|                          | 5%  | 10% |
| Signalized Urban Streets |   |     |
| Two-lane, uncongested    | 30  | 8   |
| Two-lane, congested      | 40  | 10  |
| Multi-lane, uncongested  | 18  | 5   |
| Multi-lane, congested    | 50  | 13  |
| Rural Highways           |   |     |
| Two-lane, 1,130 vph      | 25  | 6   |
| Two-lane, 1,440 vph      | 42  | 11  |

## 2.6. BIAYA OPERASI KENDARAAN

Biaya operasi kendaraan (BOK) merupakan biaya yang penting. Perbaikan atau peningkatan mutu prasarana dan sarana transportasi kebanyakan bertujuan mengurangi biaya ini. Biaya operasi kendaraan antara lain meliputi penggunaan bahan bakar, pelumas, biaya penggantian (misal Ban), biaya perawatan kendaraan, dan upah atau gaji supir. Biaya asuransi tidak termasuk BOK karena dihitung sebagai biaya kecelakaan. Beberapa faktor yang disebutkan diatas biasanya merupakan fungsi kecepatan. Rumus BOK yang digunakan adalah sebagai berikut:

- Konsumsi Bahan Bakar (KBB)

$$\text{KBB} = \text{KBB dasar} \times (1 \pm (k_k + k_l + k_r))$$

KBB dasar kendaraan golongan I

$$0,0284 V^2 - 3,0644 V + 141,68$$

KBB dasar kendaraan golongan IIA = 2,26533 x (KBB dasar golongan I)

KBB dasar kendaraan golongan IIB = 2,90805 x (KBB dasar golongan I)

$k_k$  = faktor koreksi akibat kelandaian

$k_l$  = faktor koreksi akibat kondisi arus lalu lintas

$k_r$  = faktor koreksi akibat kekasaran jalan

$V$  = Kecepatan Kendaraan (km/jam)

**Tabel 2.23 Faktor Koreksi konsumsi bahan bakar dasar kendaraan**

|  |                       |        |
|--|-----------------------|--------|
| faktor koreksi akibat kelandaian negatif ( $k_k$ )       | $g < -5\%$            | -0,337 |
|  | $-5\% \leq g < 0\%$   | -0,158 |
| faktor koreksi akibat kelandaian positif ( $k_k$ )       | $0\% \leq g < 5\%$    | 0,400  |
|  | $g \geq 5\%$          | 0,820  |
| faktor koreksi akibat kondisi arus lalu lintas ( $k_l$ ) | $0 \leq NVK < 0,6$    | 0,050  |
|  | $0,6 < NVK < 0,8$     | 0,185  |
|  | $NVK \geq 0,8$        | 0,253  |
| faktor koreksi akibat kekasaran jalan ( $k_r$ )          | $< 3 \text{ m/km}$    | 0,035  |
|  | $\geq 3 \text{ m/km}$ | 0,085  |

$g$  = kelandaian

$NVK$  = nisbah volume per kapasitas

Sumber : Perencanaan dan Permodelan Transportasi, Hal. 97

- Konsumsi Minyak Pelumas

Besarnya konsumsi dasar minyak pelumas (liter/km) sangat tergantung pada kecepatan kendaraan. Konsumsi ini kemudian dikoreksi lagi menurut tingkat kekasaran jalan.

**Tabel 2.24 Konsumsi Dasar Minyak Pelumas (liter/km)**

| Kecepatan<br>(km/jam) | Jenis Kendaraan |                 |                 |
|-----------------------|-----------------|-----------------|-----------------|
|                       | Golongan I      | Golongan<br>IIA | Golongan<br>IIB |
| 10-20                 | 0,0032          | 0,0060          | 0,0049          |
| 20-30                 | 0,0030          | 0,0057          | 0,0046          |
| 30-40                 | 0,0028          | 0,0055          | 0,0044          |
| 40-50                 | 0,0027          | 0,0054          | 0,0043          |
| 50-60                 | 0,0027          | 0,0054          | 0,0043          |
| 60-70                 | 0,0029          | 0,0055          | 0,0044          |
| 70-80                 | 0,0031          | 0,0057          | 0,0046          |
| 80-90                 | 0,0033          | 0,0060          | 0,0049          |
| 90-100                | 0,0035          | 0,0064          | 0,0053          |
| 100-110               | 0,0038          | 0,0070          | 0,0059          |

Sumber : Perencanaan dan Permodelan Transportasi, Hal. 98

**Tabel 2.25 Faktor koreksi konsumsi minyak pelumas terhadap kondisi kekasaran permukaan**

| Nilai Kekasaran | Faktor Koreksi |
|-----------------|----------------|
| < 3 m/km        | 1,00           |
| > 3 m/km        | 1,50           |

Sumber : Perencanaan dan Permodelan Transportasi, Hal. 98

- Biaya Pemakain Ban

Besarnya biaya pemakaian ban sangat tergantung pada kecepatan kendaraan dan jenis kendaraan

Kendaraan golongan I:  $Y = 0,0008848 V - 0,0045333$

Kendaraan golongan IIA :  $Y = 0,0012356 V - 0,0064667$

Kendaraan golongan IIB :  $Y = 0,0015553 V - 0,0059333$

$Y = \text{pemakaian ban per 1000 km}$

#### - Biaya Pemeliharaan

Komponen biaya pemeliharaan yang paling dominan adalah biaya suku cadang dan upah montir.

##### a. Suku Cadang

$$\begin{array}{l} \text{Golongan I} : Y = 0,0000064 V + \\ 0,0005567 \end{array}$$

$$\begin{array}{l} \text{Golongan IIA} : Y = 0,0000332 V + \\ 0,0020891 \end{array}$$

$$\begin{array}{l} \text{Golongan IIB} : Y = 0,0000191 V + \\ 0,0015400 \end{array}$$

$Y = \text{biaya pemeliharaan suku cadang per 1000 km}$

##### b. Montir

$$\begin{array}{l} \text{Golongan I} : Y = 0,00362 V + 0,36267 \end{array}$$

$$\begin{array}{l} \text{Golongan IIA} : Y = 0,02311V + 1,97733 \end{array}$$

$$\begin{array}{l} \text{Golongan IIB} : Y = 0,01511 V + 1,21200 \end{array}$$

$Y = \text{jam kerja montir per 1000 km}$

#### - Biaya Penyusutan

Biaya penyusutan hanya berlaku untuk perhitungan BOK pada jalan tol dan arteri, besarnya berbanding terbalik dengan kecepatan kendaraan.

$$\begin{array}{l} \text{Golongan I} : Y = 1/(2,5 V + 125) \end{array}$$

$$\begin{array}{l} \text{Golongan IIA} : Y = 1/(9,0 V + 450) \end{array}$$

$$\begin{array}{l} \text{Golongan IIB} : Y = 1/(6,0 V + 300) \end{array}$$

$Y = \text{biaya penyusutan per 1000 km (sama dengan } \frac{1}{2} \text{ nilai penyusutan kendaraan)}$

#### - Bunga Modal

Menurut *Road User Cost Models* (1991), besarnya biaya bunga modal per kendaraan per 1000 km ditentukan oleh persamaan berikut.

Bunga modal = 0,22% (harga kendaraan baru).

- Biaya Asuransi

Besarnya biaya asuransi berbanding terbalik dengan kecepatan. Semakin tinggi kecepatan kendaraan, semakin kecil biaya asuransi.

Golongan I :  $Y = 38/(500V)$

Golongan IIA :  $Y = 6/(2571,42857 V)$

Golongan IIB :  $Y = 61/(1714,28571 V)$

## 2.7. NILAI WAKTU

Nilai waktu adalah sejumlah uang yang disediakan seseorang untuk dikeluarkan (dihemat) untuk menghemat satu unit waktu perjalanan. Nilai waktu biasanya sebanding dengan pendapatan perkapita, merupakan perbandingan yang tetap dengan tingkat pendapatan. Ini didasari asumsi bahwa waktu perjalanan tetap konstan sepanjang waktu, relatif terhadap pengeluaran konsumen. Merujuk dari PT Jasa Marga tahun 1996 nilai waktu setiap golongan adalah

Golongan I : Rp 12.287 /jam/kendaraan

Golongan IIA : Rp 18.534 /jam/kendaraan

Golongan IIB : Rp 13.786 /jam/kendaraan

Faktor koreksi untuk Jawa Timur = 0,25

## 2.8. SURVEY LALU LINTAS

Data volume lalu lintas yang digunakan untuk analisa terdiri dari data primer dan data sekunder. Untuk data primer didapat dari hasil survey lalu lintas di lapangan, sedangkan untuk data sekunder diperoleh dari Balai Pemeliharaan Jalan Dinas Pekerjaan Umum Mojokerto.

Survey yang dilaksanakan untuk mendapatkan data primer menggunakan cara manual count, yaitu sebuah cara yang menggunakan jasa manusia (surveyor) untuk mencatat

volume lalu lintas dengan cara manual. Survey ini dilakukan untuk menentukan :

- Jumlah kendaraan yang melintasi jalan
- Jenis-jenis kendaraan
- Perhitungan pejalan kaki(pedestrian)

Data jumlah volume lalu lintas untuk data primer dan data sekunder dinyatakan dalam satuan kendaraan/jam.

Selain survey volume lalu lintas, juga dilakukan survey pengambilan data waktu tempuh atau travel time. Yang nantinya data ini akan digunakan untuk mencari nilai waktu guna mendapatkan biaya perjalanan. Survey ini dilakukan dimasing-masing ruas yang telah dibagi dengan jumlah sampel sesuai dengan nilai koreksi yang diinginkan dan tipe jalur yang diamati.

#### FORM SURVEY TRAFFIC COUNTING

Gambar 2.6 Form Survey Travel Time dan Delay

## 2.9. PERTUMBUHAN LALU LINTAS MASA YANG AKAN DATANG

Pada studi yang dilaksanakan saat ini, sangat perlu adanya suatu peramalan lalu lintas untuk masa yang akan datang. Dalam hal ini, pertumbuhan arus lalu lintas yang terjadi dianggap sebanding dengan pertumbuhan dari jumlah kendaraan. Oleh karena itu, peramalan lalu lintas dapat diestimasi dengan bertambahnya jumlah kendaraan yang ada.

Bertambahnya jumlah kendaraan yang ada itu sendiri memiliki sebuah korelasi yang signifikan dengan periode waktu, sehingga pertumbuhan kendaraan dapat diramalkan sesuai dengan periode waktu yang terjadi. Untuk mengetahui berapa besarnya pertambahan jumlah kendaraan bermotor dari masing-masing tipe kendaraan, dapat dipergunakan persamaan regresi linier. Adapun bentuk umum dari persamaan regresi linier adalah sebagai berikut :

$$Y = a + bX$$

$Y$  = variabel yang diramalkan ( dalam hal ini jumlah kendaraan )

$X$  = variable yang meramalkan ( dalam hal ini periode waktu )

Untuk menentukan harga regresi  $a$ , digunakan persamaan sebagai berikut :

$$a = \frac{y - bx}{n}$$

sedangkan untuk menentukan harga koefisien  $b$ , digunakan persamaan sebagai berikut :

$$b = \frac{n(\sum xy) - (\sum x)(\sum y/n)}{\sum x^2 - (\sum y)^2/n}$$

Dimana:

- X = variabel bebas
- y = variabel tak bebas
- n = jumlah data
- a,b = koefisien regresi

satu analisa dengan menggunakan metode regresi harus diuji terlebih dahulu untuk menetahui apakah terdapat korelasi antara variabel bebas (x) dan variabel tak bebas (y). Korelasi antara x dan y dinyatakan signifikan jika harga  $R$  yang diperoleh  $-1 < R < 1$ , dimana  $R \neq 0$ . Untuk menentukan harga korelasi  $R$  dinyatakan dengan rumus :

$$R = \frac{n(\sum xy) - (\sum x)(\sum y)}{\sqrt{n(\sum x^2) - (\sum x)^2} \sqrt{n(\sum y^2) - (\sum y)^2}}$$

**R = Korelasi**

## 2.10. REFERENSI TUGAS AKHIR SEBELUMNYA

Pada tahun 2004 perempatan bypass-jayanegara (terminal Kertajaya Mojokerto) telah diambil sebagai judul Tugas Akhir yang pada perhitungannya mendapatkan alternatif perbaikan untuk mengatasi masalah kemacetan yang terjadi, yaitu :

- Alternatif 1 = Persinyalan 3 fase, perubahan geometric
- Alternatif 2 = Persinyalan 3 fase, perubahan geometric, belok kiri mengikuti lampu,  $DS < 0,75$
- Alternatif 3 = Persinyalan 4 fase, belok kiri menikuti lampu  $DS > 0,75$

## BAB III

### METODOLOGI

#### 3.1. METODOLOGI PERHITUNGAN

Perhitungan untuk menganalisa kinerja sebuah jalan dalam penyusunan tugas akhir ini menggunakan sebuah program yang disebut KAJI. Program ini adalah sebuah program Bantu yang bias digunakan untuk memperkirakan tingkat kinerja dari fasilitas lalu lintas pada kondisi lalu lintas, geometri, dan kondisi lingkungan tertentu. Program KAJI ini sendiri terdiri dari 7 modul, Simpang bersinyal, simpang tak bersinyal, bagian jalinan tunggal, bundaran, jalan perkotaan, jalan luar kota, dan jalan bebas hambatan (Tol).

Pada penyusunan tugas akhir ini, modul yang digunakan adalah modul jalan luar kota dan modul jalan perkotaan. Untuk modul jalan luar kota, perhitungan hanya dilakukan dengan tujuan menganalisa operasional dan perencanaan saja. Dalam analisa operasional kita bisa mendapatkan kinerja sebuah jalan pada saat ini yaitu DS, Travel Time dan Biaya Operasional Kendaraan serta Nilai Waktu. Sedangkan dalam analisa perencanaan digunakan untuk mengetahui kinerja jalan pada masa yang akan datang sesuai yang direncanakan (dengan kondisi jalur lalu lintas rencana). Untuk modul jalan perkotaan hanya digunakan untuk mencari kinerja saat ini saja tanpa memperkirakan tingkat pertumbuhan lalulintas dalam masa rencana.

##### 3.1.1. METODOLOGI PERHITUNGAN RUAS JALAN

###### ❖ Analisa Operasional

Analisa operasional untuk segmen jalan dengan kondisi geometri, kondisi lalulintas dan kondisi lingkungan yang ada bertujuan untuk menentukan kapasitas dan derajat kejemuhan saat ini serta mendapatkan kecepatan perhitungan

(teoritis). Prosedur dalam perhitungan untuk analisa operasional terdiri dari 3 langkah, yaitu:

- ✓ Data Masukan ( Langkah A)
- ✓ Analisa perhitungan (Langkah B )
- ✓ Evaluasi tingkat kinerja (langkah C)

#### ➤ Langkah A : DATA MASUKAN

Langkah A ini terdiri dari empat macam data masukan, yaitu:

- DATA UMUM

Pada bagian ini data yang dimasukkan adalah data mengenai penentuan dan pengenalan segmen jalan, antara lain :

- Untuk panjang segmen jalan dan batas segmen jalan, data masukan ditentukan dari peta lokasi study yang diperoleh dari Dinas Pekerjaan umum Bina Marga.
- Untuk kode segmen jalan, nomor ruas jalan, kelas administratif dan kelas fungsional jalan, data masukan diperoleh dari bagian proyek perencanaan dan pengawasan teknik jalan nasional propinsi jawa timur dinas pekerjaan umum bina marga.
- Untuk tipe jalan serta data pendukung lainnya, diperoleh melalui pengamatan langsung dilapangan.

- DATA KONDISI GEOMETRIK

Data pendukung untuk kondisi geometrik jalan yang ditinjau meliputi:

- Data pengembangan disamping jalan dan kondisi permukaan jalan diperoleh melalui pengamatan langsung dilapangan.
- Data penampang melintang jalan diperoleh dari Dinas Pekerjaan Umum Bina Marga.
- Data kelas jarak pandang ditentukan menggunakan tabel 2.9 dengan memperhatikan tipe jalan.

#### ○ DATA KONDISI LALULINTAS

Untuk mendapatkan data kondisi lalu lintas diperlukan data arus lalu lintas pada jam rencana menurut jenis kendaraan (terklasifikasi) dan jurusan (arah) yang tersedia. Ada 5 (lima) jenis kendaraan untuk keperluan analisa kinerja jalan luar kota (lihat table 2.1) dan 3 Kendaraan untuk jalan perkotaan (lihat tabel 2.10). Data volume lalu lintas yang dipakai dalam penyusunan tugas akhir ini diperoleh dari Dinas Pekerjaan Umum Bina Marga Jawa Timur.

#### ○ DATA HAMBATAN SAMPING

Untuk kelas hambatan samping ditentukan dari table 2.5 untuk jalan luar kota dan tabel 2.14 untuk jalan perkotaan. Dengan mengetahui data frekuensi berbobot dari kejadian di kedua sisi jalan yang ditinjau, yang datanya diperoleh melalui survei dilapangan.

#### o DATA TRAVEL TIME

Data ini digunakan untuk mencari nilai rata-rata waktu tempuh hasil pengamatan langsung di setiap ruas dan di masing-masing jalur. Pengambilan data ini menggunakan nilai koreksi 10% sehingga sampel yang dibutuhkan sebanyak 6 untuk jalur bypass karena volume yang melintas masih dibawah 1440 kendaraan/jam dan 10 untuk jalur dalam kota. Pengambilan sampel menggunakan format survey seperti ditunjukkan pada bab sebelum ini dengan cara mengikuti kendaraan yang melintas.

#### o DATA BIAYA OPERASIONAL KENDARAAN DAN NILAI WAKTU

Untuk data BOK digunakan komponen dalam perhitungan seperti biaya konsumsi bahan bakar, biaya minyak pelumas, biaya pemakaian ban, pemeliharaan, biaya penyusutan, bunga modal, dan biaya asuransi. Untuk perhitungan BOK akan dihitung sesuai dengan masing-masing kecepatan yang ditinjau. Sedangkan untuk mencari nilai waktu dibutuhkan dibutuhkan data niali waktu rujukan pada PT Jasa marga dan data pertumbuhan ekonomi tiap tahunnya.

#### ➤ Langkah B : Analisa perhitungan

Pada langkah ini, untuk menentukan kapasitas digunakan data dari Langkah A. data pendukung lainnya ditentukan dengan cara melihat tabel.

- Kapasitas dasar untuk jalan luar kota 4/2 dan 2/2 dapat ditentukan menggunakan tabel 2.21 dengan memperhatikan tipe jalanya dan untuk jalan perkotaan pada tabel 2.22.

- Faktor penyesuaian kapasitas akibat lebar jalur lalu lintas dapat ditentukan dengan menggunakan tabel 2.7(luar kota) dan tabel 2.17(dalam kota) dengan memperhatikan tipe jalan dan lebar efektif jalur lalu lintas.
- Factor penyesuaian kapasitas akibat pemisahan arah dapat ditentukan dengan menggunakan tabel 2.4(luar kota) dan tabel 2.13(dalam kota) dengan memperhatikan tipe jalan dan pemisahan arah
- Factor penyesuaian kapasitas akibat hambatan samping dapat ditentukan dengan menggunakan tabel 2.6(luar kota), tabel 2.15, dan tabel 2.16(dalam kota) dengan memperhatikan tipe jalan dan kelas hambatan samping.

➤ Langkah C : Evaluasi Tingkat kinerja

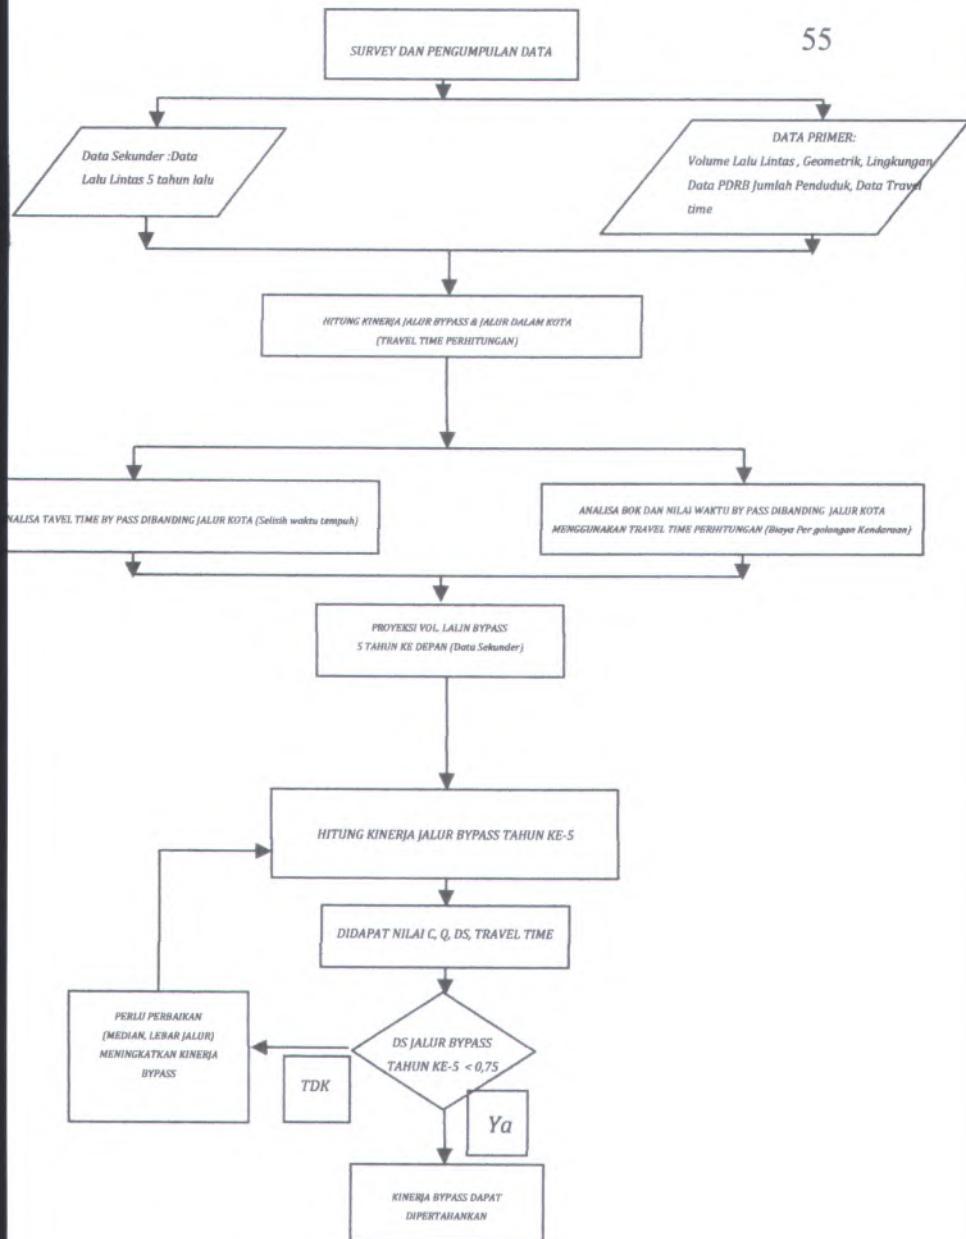

Pada langkah ini data masukan yang diperlukan diperoleh dari langkah A dan langkah B yang telah ditentukan sebelumnya. Pada bagian akhir dari langkah C ini nantinya akan diperoleh nilai-nilai kinerja jalan untuk kondisi saat ini yaitu : Kapasitas sesungguhnya, arus lalu lintas yang yang terjadi, dan derajat kejemuhanya, serta kecepatan dari hasil perhitungan. Kemudian dari nilai kecepatan tersebut bias dihitung waktu tempuh yang terjadi jika melalui jalur bypass dibandingkan jalur dalam kota. Dan nantinya akan dibandingkan juga dengan nilai travel time yang didapatkan dari pengamatan langsung dilapangan. Selain itu juga akan ditinjau tentang besaran biaya operasional kendaraan yang

dikeluarkan serta nilai waktu yang terjadi antara jalur bypass dibandingkan jalur dalam kota. Perhitungan BOK menggunakan data-data yang berhubungan dengan kendaraan misalnya, harga mobil, harga bahan bakar, oli, perawatan dan lain-lain. Sedangkan untuk nilai waktu didapat dari perhitungan yang menggunakan data Pendapatan perkapita daerah studi, PDRB, Jumlah penduduk dan lain-lain.

#### ➤ Analisa Perencanaan

Tujuan analisa perencanaan adalah menetukan kapasitas dan derajat kejemuhan untuk masa yang akan datang serta mencari nilai biaya perjalanan dan travel time dengan menggunakan data hasil perkiraan volume lalu lintas sampai akhir masa rencana dan juga lebar jalur lalulintas rencana. Prosedur perhitungan yang dipergunakan untuk analisa perencanaan sama dengan prosedur perhitungan untuk analisa operasional.

Metodologi perhitungan untuk analisa operasional dan perencanaan ditunjukkan pada gambar 3.1 berikut ini.

Gambar 3.1. Metodologi Perhitungan

## **BAB IV**

### **ANALISA FAKTOR PERTUMBUHAN LALU LINTAS**

#### **4.1. UMUM**

Volume lalu lintas cenderung meningkat karena kebutuhan akan transportasi yang begitu besar dalam aktivitas kehidupan sehari-hari. Kecenderungan tingkat populasi yang terus meningkat serta tuntutan perkembangan dalam sector ekonomi dan industri menjadikan kebutuhan transportasi yang meningkat khususnya kebutuhan akan prasarana dan fasilitas jalan.

Pada tahun-tahun kedepan perlu dianalisa apakah jalur by pass Mojokerto masih dapat menampung volume lalu lintas yang lewat. Sedangkan untuk menganalisa kondisi lalu lintas pada masa yang akan datang, diperlukan data lalu lintas pada tahun tersebut. Karena hal itulah perlunya dilakukan peramalan pertumbuhan lalu lintas pada masa yang kita inginkan tersebut.

Pertumbuhan lalu lintas dianggap sebanding dengan pertumbuhan kendaraan dengan demikian dapat berarti peramalan lalu lintas dapat diestimasi dengan pertumbuhan kendaraaan.

Peramalan yang dilakukan adalah terhadap motor, mobil penumpang dan kendaraan berat. Dalam peramalan juga dibutuhkan data volume kendaraan yang melintas di jalur by pass mulai dari tahun 2004-2008 yang dapat dilihat pada table 4.1 dibawah ini yang selengkapnya pada Lampiran B.

**Tabel 4.1 Data Volume By Pass Mojokerto Arah Sby-Jbg**

| <b>Tahun</b> | <b>MC</b> | <b>LV</b> | <b>MHV</b> | <b>LB</b> | <b>LT</b> |

#### 4.2 METODE REGRESI

Metode yang digunakan adalah dengan metode regresi linear dengan menggunakan perumusan yuang telah dituliskan pada BAB II.

Contoh perhitungan persamaan regresi linear untuk mencari proyeksi jumlah kendaraan bermotor pada arah A(Jombang-Surabaya) dan B (Surabaya-Jombang) sebagai berikut :

1. Ruas Surabaya-Jombang (arah B)

Dari data yang didapat dari dinas Bina Marga dapat dihitung besarnya nilai pertumbuhan kendaraan yang melewati ruas Sby-Jbg seperti ditunjukkan pada table berikut :

**Tabel 4.3 Data Volume LV Pada Tahun Sebelumnya Pada Arah B**

| Tahun  | 2004 | 2005 | 2006 | 2007 | 2008 |
|--------|------|------|------|------|------|
| Volume | 556  | 620  | 691  | 771  | 859  |

Contoh Perhitungan regresi linear secara manual kendaraan LV

| Tahun         | x            | y           | $X^2$           | xy             |
|---------------|--------------|-------------|-----------------|----------------|
| 0             | 2004         | 556         | 4016016         | 1114224        |
| 1             | 2005         | 620         | 4020025         | 1243100        |
| 2             | 2006         | 691         | 4024036         | 1386146        |
| 3             | 2007         | 771         | 4028049         | 1547397        |
| 4             | 2008         | 859         | 4032064         | 1724872        |
| <b>Jumlah</b> | <b>10030</b> | <b>3497</b> | <b>20120190</b> | <b>7015739</b> |

$$Y = a + bX$$

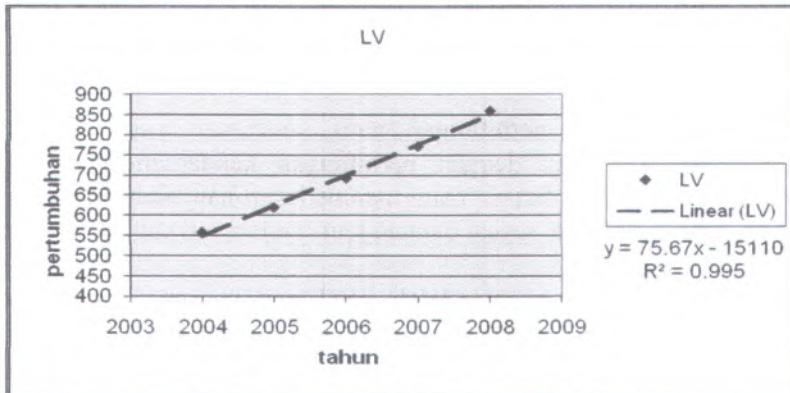

$$a = \frac{y - bx}{n} \quad b = \frac{n(\sum xy) - (\sum x \sum y / n)}{\sum x^2 - (\sum y)^2 / n}$$

Di dapat :  $a = -15110$

$$b = 75,67$$

Maka  $y = 75,67x - 15110$

Dalam bentuk grafik dapat dilihat pada gambar 4.1 berikut

Gambar 4.1 Grafik Pertumbuhan Kendaraan LV Arah B

Dari hasil perhitungan regresi diatas maka dapat dihitung jumlah pertumbuhan kendaraan ringan (LV) pada ruas Sby-Jbg pada umur rencana 5 tahun ke depan seperti dalam table 4.4 berikut ini.

**Tabel 4.4 Jumlah Pertumbuhan Kendaraan Ringan 2014**

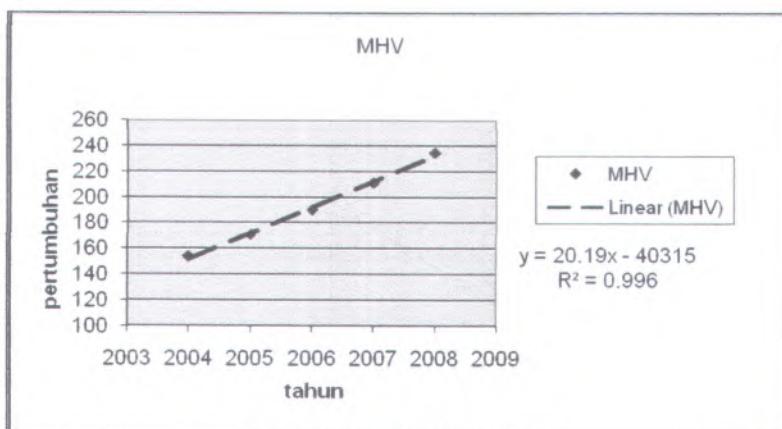

| No. | Tahun<br>(x) | Jumlah<br>Kendaraan<br>(y) | Pertumbuhan<br>(%) |
|-----|--------------|----------------------------|--------------------|
| 1   | 2004         | 556                        | -                  |
| 2   | 2005         | 620                        | 10.3               |
| 3   | 2006         | 691                        | 10.3               |
| 4   | 2007         | 771                        | 10.4               |
| 5   | 2008         | 859                        | 10.2               |
| 6   | 2009         | 927                        | 7.3                |
| 7   | 2010         | 1002                       | 7.6                |
| 8   | 2011         | 1078                       | 7.0                |
| 9   | 2012         | 1154                       | 6.6                |
| 10  | 2013         | 1230                       | 6.2                |
| 11  | 2014         | 1306                       | 5.8                |

*Sumber : Perhitungan*

Dari hasil analisa di atas maka dapat diketahui prediksi pertumbuhan LV antara 2009 s/d 2014 adalah 40,5%.

Untuk perhitungan jenis kendaraan yang lainnya prosesnya sama dengan perhitungan kendaraan jenis LV seperti tertulis diatas. Yang membedakan hanyalah data yang digunakan harus sesuai dengan jenis kendaraan yang ditinjau.

Dibawah ini adalah hasil perhitungan untuk jenis kendaraan MHV. Grafiknya dapat dilihat pada gambar 4.2 dan tabel peramalannya dapat dilihat pada tabel 4.5.

Gambar 4.2 Grafik Pertumbuhan MHV Arah B

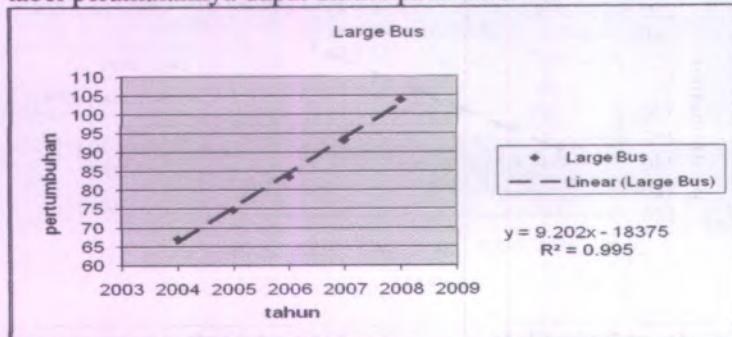

**Tabel 4.5 Jumlah Pertumbuhan kendaraan MHV 2014**

| No. | Tahun<br>( x ) | Jumlah<br>Kendaraan<br>( y ) | Pertumbuhan<br>( % ) |
|-----|----------------|------------------------------|----------------------|
| 1   | 2004           | 154                          | -                    |
| 2   | 2005           | 171                          | 9.9                  |
| 3   | 2006           | 190                          | 10.0                 |
| 4   | 2007           | 211                          | 10.0                 |
| 5   | 2008           | 235                          | 10.2                 |
| 6   | 2009           | 252.8                        | 7.0                  |
| 7   | 2010           | 273                          | 7.4                  |
| 8   | 2011           | 293.2                        | 6.9                  |
| 9   | 2012           | 313                          | 6.4                  |
| 10  | 2013           | 334                          | 6.1                  |
| 11  | 2014           | 353.8                        | 5.7                  |

Sumber : Perhitungan

Dari hasil analisa di atas maka dapat diketahui prediksi pertumbuhan MHV antara 2009 s/d 2014 adalah 39,5%.

Dibawah ini adalah hasil perhitungan untuk jenis kendaraan LB. Grafiknya dapat dilihat pada gambar 4.3 dan tabel peramalannya dapat dilihat pada tabel 4.6.

Dari hasil analisa di atas maka dapat diketahui prediksi pertumbuhan LB antara 2009 s/d 2014 adalah 43,8%.

## **BAB V**

### **ANALISA KINERJA JALUR BY PASS DAN JALUR DALAM KOTA**

#### **5.1 Umum**

Setelah didapatkan forecasting (peramalan) lalu lintas harian rata-rata tahunan aktual pada masing-masing tahun rencana, maka langkah selanjutnya adalah menghitung kinerja dari jalur by pass mojokerto serta jalur dalam kota. Dari perhitungan yang akan dilakukan akan didapatkan nilai travel time hasil perhitungan dan juga nilai DS dari masing-masing jalur yang ditinjau. Sebelum menganalisa kinerja, perlu dilakukan survey kondisi eksisting terlebih dahulu.

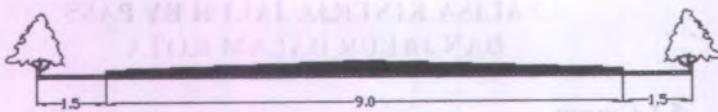

#### **5.2 Data Hasil Survey Kondisi Eksisting**

##### **5.2.1 Geometri Jaringan Jalan**

Pengambilan data dengan metode pengukuran dilakukan untuk mendapatkan dimensi dan geometri dari jaringan jalan di Mojokerto, yang dalam hal ini adalah Jalan By Pass Mojokerto, Jalan Raya Mlirip, Jalan Gajah Mada, Jalan Raden Wijaya, Jalan RA.Basuni. Data ini diperlukan sebagai data masukan yang diperlukan dalam penganalisaan kinerja jaringan jalan menggunakan program KAJI.

Hasil survey geometri dari lokasi yang ditinjau yaitu:

- a. Ruas Jl. Mlirip-Sekarputih (Arteri Primer).  
Lebar badan jalan = 9,00 meter  
Panjang ruas jalan = 2.500,00 meter  
Type jalan = 2/2 UD

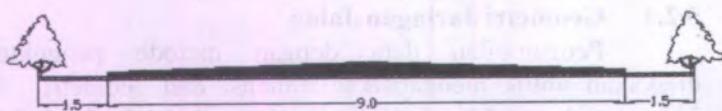

Gambar 5.1. Potongan melintang ruas Jl. Raya By Pass

b. Ruas Jl. Sekarputih-Terminal Kertajaya (Arteri)

Lebar badan jalan = 9,00 meter

Panjang ruas jalan = 3.600,00 meter

Type jalan = 2/2 UD

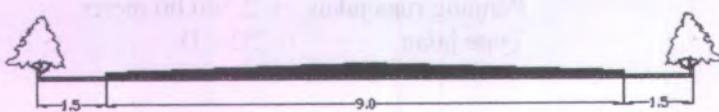

Gambar 5.2. Potongan melintang ruas Jl. Skrpth-Terminal

c. Ruas Jl. Terminal Kertajaya-Jampirogo (Arteri)

Lebar badan jalan = 9,00 meter

Panjang ruas jalan = 4.200,00 meter

Type jalan = 2/2UD

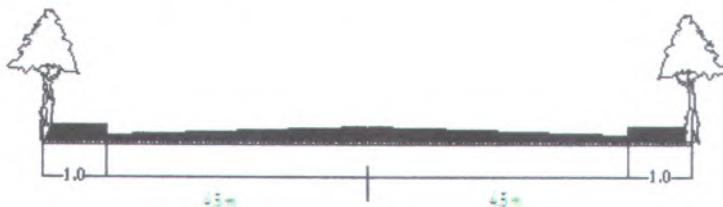

Gambar 5.3. Potongan melintang ruas Jl. Terminal-Jampirogo

- d. Ruas Jl. RA. Basuni (Arteri Sekunder 2 ruas)  
 Lebar badan jalan = 7,00 meter  
 Panjang ruas jalan = 2.700 dan 1.100 meter  
 Type jalan = 2/2 UD

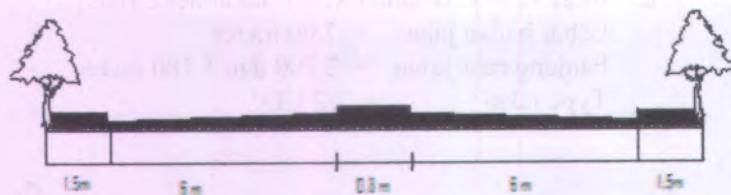

Gambar 5.4. Potongan melintang ruas Jl. RA. Basuni

- e. Ruas Jl. Raden Wijaya (Kolektor Sekunder)  
 Lebar badan jalan = 9,00 meter  
 Panjang ruas jalan = 1.400,00 meter  
 Type jalan = 4/2 UD

Gambar 5.5. Potongan melintang ruas Jl. RA. Basuni

- f. Ruas Jl. Gajah Mada (Arteri Sekunder 3 ruas)  
 Lebar badan jalan = 12,00 meter  
 Panjang ruas jalan = 1.100 m, 0,500m, dan  
 1.500 meter  
 Type jalan = 4/2 UD

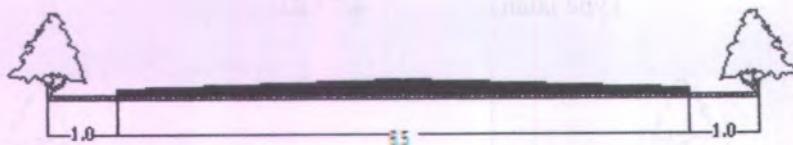

Gambar 5.6. Potongan melintang ruas Jl. RA. Basuni

g. Ruas Jl. Raya Mirip (Arteri Sekunder)

Lebar badan jalan = 6,50 meter

Panjang ruas jalan = 2.900,00 meter

Type jalan = 2/2 UD

Gambar 5.7. Potongan melintang ruas Jl. RA. Basuni

### 5.2.2 Survey Traffic Counting

Selain data yang diperoleh dari pengukuran dimensi ruas jalan juga diperlukan data lalu lintas yang melewati jalan tersebut yaitu yang melalui jalur dalam kota dan jalur luar kota. Dengan pengambilan data diambil pada pagi dan sore hari di masing-masing ruasnya. Hal ini dilakukan karena dari data sekunder yang didapat dari Dinas Bina Marga, kecenderungan jam puncak di jalur yang ditunjau terjadi pada antara pukul 6.00 – 8.00 pagi dan 16.00-18.00 sore.

Pengambilan data lalu lintas dilakukan dengan menempatkan surveyor di beberapa titik pada jalur yang ditinjau seperti terlihat pada gambar 5.8 dibawah ini.

Gambar 5.8. Pengambilan Data oleh Surveyor

Pada form survey traffic counting terdapat kolom jenis dan jumlah kendaraan. Untuk jenis kendaraan yang digunakan, terdapat pilihan Sepeda motor (MC), Mobil penumpang (LV), Kendaraan berat Menengah (MHV), Kendaraan berat (HV) untuk jalan By pass dan untuk jalur dalam kota jenis kendaraan sama dengan di jalur by pass kecuali tidak adanya jenis MHV. Dari data-data lalu lintas itu maka didapatkan kinerja jalan dan persimpangan. Data yang didapat dari survey traffic counting bisa dilihat pada tabel di lampiran A.

### 5.3 Analisa Kinerja Jalur Bypass

Dalam studi yang dilakukan dalam tugas akhir ini menghitung kinerja pada tahun 2009 dan tahun rencana 5 tahun kedepan. Hal ini dilakukan Dengan pertimbangan bahwa pertumbuhan ekonomi semakin tahun terus meningkat sehingga secara tidak langsung memicu pergerakan kendaraan dan hal ini perlu dipikirkan antisipasinya, sehingga mulai sekarang kita bisa memikirkan alternative yang terbaik jika terjadi penurunan kinerja by pass.

Analisa kondisi lalu lintas by pass juga bisa mendapatkan nilai travel time perhitungan yang nantinya akan dibandingkan dengan nilai travel time jalur dalam kota yang akan dikorelasikan kedalam nilai uang menjadi nilai waktu. Selain dari nilai perhitungan juga akan dibandingkan dengan travel time dari hasil pengamatan yang akan ditunjukkan pada Bab yang lain.

Perhitungan yang dilakukan dengan memasukkan volume LHRT akual dari hasil survey langsung di lapangan. Dan juga hasil dari perhitungan forecasting 5 tahun kedepan yang telah dilakukan pada bab 4 tugas akhir ini. Untuk menghitung derajat kejenuhan pada by pass mojokerto digunakan program KAJI.

Hasil dari perhitungan yang dilakukan menggunakan program KAJI ditunjukan pada tabel 5.1 dan tabel 5.2 dibawah ini, yang akan menunjukkan nilai besarnya DS dan juga travel time dari hasil perhitungan di masing-masing ruas.

Hasil output dari perhitungan program KAJI selengkapnya bisa dilihat pada Lampira D (lampiran hasil KAJI kondisi eksisting).

Pada perhitungan travel time dipakai 6 sampel karena volume yang melintas pada jalur by pass dari hasil survey traffic counting kurang dari 1440 kendaraan per jam nya. Sehingga data hasil pengamatan nantinya akan dirata-rata selanjutnya dibandingkan dengan hasil perhitungan.

**Tabel 5. 1. Volume dan DS Jalur Luar Kota tahun 2009**

| Jalan                  | Ruas                | Arah     | Volume | Kapasitas | DS    | TT<br>(sec) |

|            |                        | Jombang  |        |           |       | 182         |

Sumber: Hasil Perhitungan

Hasil dari perhitungan yang dilakukan menggunakan program KAJI yang ditunjukan pada tabel diatas,

menunjukkan bahwa belum ada jalan yang nilai DS nya melebihi kondisi kritis. Semua jalur masih dalam kondisi lancar. Namun yang akan ditinjau lebih lanjut adalah nilai dari travel time nya karena nantinya nilai tersebut akan dibandingkan dengan nilai travel time yang didapat dari pengamatan/survei langsung di lapangan.

Selain untuk pembandingan dengan nilai travel time dari lapangan, nilai travel time hasil dari perhitungan KAJI tersebut nantinya juga digunakan dalam perhitungan biaya perjalanan yaitu nilai waktu, yang akan dibahas pada Bab selanjutnya.

#### **5.4 Analisa Travel Time Jalur Bypass dan Jalur Dalam Kota**

Setelah analisa DS kondisi eksisting dilakukan selanjutnya yang dilakukan adalah menganalisa waktu tempuh atau travel time yang didapat dari program KAJI untuk masing2 jalur yaitu jalur bypass dan jalur dalam kota.

Seperti hasil yang didapat dari KAJI kita ketahui bahwa waktu tempuh perhitungan adalah untuk masing – masing ruas. Selanjutnya waktu perhitungan tersebut dijumlahkan sesuai dengan jalur yang sesuai, sehingga nantinya kita akan mendapatkan 2 nilai waktu tempuh yakni waktu tempuh Jalur bypass dan jalur dalam kota. Seperti yang terdapat dalam tabel 5.3 dibawah ini.

**Tabel 5. 3. Tabel Rekapitulasi nilai Waktu Tempuh hasil perhitungan tahun 2009**

| Arah         | Jalur      | Ruas              | Waktu Tempuh (detik) | $\Sigma TT$ masing masin jalur |
|--------------|------------|-------------------|----------------------|--------------------------------|
| Surab<br>aya | By<br>Pass | Mlirip-Skrpth     | 113                  | 457                            |
|              |            | Skrpth-Terminal   | 150                  |                                |

Sumber: Hasil Perhitungan

Dari hasil yang bisa dilihat pada tabel diatas dapat disimpulkan bypass memang bisa mengurangi waktu tempuh untuk melewati kota mojokerto sampai dengan 50% . Namun itu adalah hasil teoritis, yakni hasil dari perhitungan. Sedangkan kalau menurut pengamatan langsung (praktek) bisa jadi sama atau bahkan berbeda dai hasil pehitungan.

Metode yang dipakai dengan cara mengikuti sampel mobil yang lewat pada jalur bypass dan jalur kota. Hal ini dilakukan pada jam sibuk pagi hari. Jumlah sampel berkisar antara 8-10 sampel untuk masing-masing jalur, sesuai dengan ketentuan pengambilan sampel travel time yang terdapat pada Bab 2 tunjauan pustaka.

Data rata-rata travel time kendaraan hasil dari pengamatan langsung dilapangan dapat dilihat pada tabel 5.4.

**Tabel 5.4 . Tabel Rekapitulasi nilai Waktu Tempuh hasil pengamatan rata-rata tahun 2009.**

| Arah     | Jalur   | Ruas                   | Waktu Tempuh(detik) | $\Sigma$ TT masing masing jalur |
|----------|---------|------------------------|---------------------|---------------------------------|
| Surabaya | By Pass | Mlirip-Skrpth          | 202                 | 855                             |
|          |         | Skrpth-Terminal        | 320                 |                                 |

|          |         | 817                     | Perhitungan |

*Sumber: Hasil Perhitungan*

Dari tabel perbandingan nilai travel time diatas terdapat selisih waktu yang menunjukkan jalur kota lebih lama dari jalur bypass. Perbedaan yang terjadi pada jalur bypass antara perhitungan dan pengamatan menunjukkan terjadi hambatan yang cukup berpengaruh pada jalur by pass sehingga mempengaruhi laju perjalanan dan menambah lama waktu tempuhnya. Sedangkan untuk jalur dalam kota tidak terjadi perbedaan yang mencolok antara hasil dari perhitungan dan hasil dari pengamatan langsung dilapangan.

Perbedaan yang terjadi bisa dikarenakan banyak sebab, misal kegiatan samping jalan, banyak keluar masuk kendaraan, dan lain-lain. Total jarak masing-masing jalur sebenarnya tidak berbeda jauh. Jalur bypass panjangnya mencapai 10,3 km sedangkan jalur dalam kota 11,2 km. Banyaknya waktu yang dibutuhkan untuk melewati mojokerto melalui jalur kota bisa dikarenakan pengurangan atau pembatasan kecepatan yang biasanya diberlakukan didalam kota, sehingga pengguna jalan tidak leluasa memacu kendaraannya, karena terbatasnya kecepatan. Selain itu dalam kota lebih banyak kegiatan samping jalan dari pada by pass.

Namun perbedaan waktu antara kedua jalur tersebut juga perlu diperhatikan lagi, karena penghematan selisihnya saat ini hanya berkisar 3 menit. Maka perlu ditingkatkan lagi kinerja by pass sehingga bisa mengurangi waktu tempuhnya, agar lebih singkat lagi dari kondisi eksisting.

Selain pada masing-masing jalur yang terdapat perbedaan, pada masing-masing tipe pencarian data juga terdapat selisih. Yakni antara hasil dari perhitungan dan juga pengamatan. Bisa dilihat pada hasil di jalur bypass, terdapat perbedaan yang mencolok antara pengamatan dan juga perhitungan. Hal ini bisa disebabkan karena beberapa faktor, misalnya pengurangan kecepatan karena adanya jalur Rel kereta api yang melintas di jalur by pass. Hal ini mengakibatkan pengurangan kecepatan yang imbasnya adalah bertambahnya waktu perjalanan. Belum lagi antrian yang ditimbulkan akibat jalur ini. Karena jalur yang tersedia hanya ada dua sehingga kendaraan harus antri untuk melintasi Rel KA. Seperti tampak pada gambar 5.9 dibawah ini.

5.9 Antrian kendaraan akibat Jalur Rel

Selain itu bisa juga disebabkan karena banyak sekali kendaraan berat yang melintas di jalur bypass. Hal ini

menyebabkan iring-iringan kendaraan yang juga membuat waktu perjalanan bertambah, karena kecepatan dari kendaraan berat ini rendah sedang jalur tak leluasa untuk menyiap, jadi kendaraan yang dibelakang truk dengan terpaksa mengikuti truk yang berjalan lambat. Seperti tampak pada gambar 5.10 dibawah ini.

5.10 Antrian kendaraan akibat kendaraan berat

Gambar 5.11 Iring-iringan kendaraan akibat kendaraan berat

### 5.5 Analisa Kinerja Jalur Bypass pada Tahun Rencana

Setelah dilakukan perhitungan peramalan volume lalu lintas pada Bab 4, maka kita sudah bisa menghitung perkiraan kinerja Bypass pada saat mendatang. Kondisi yang dihitung adalah kondisi eksisting tetapi menggunakan volume peramalan. Hal ini akan dapat mengetahui apakah kondisi bypass saat ini jika tidak ada perbaikan sampai tahun rencana, apakah masih bisa menampung kendaraan yang melintas atau sudah melebihi kapasitas bypass. Sehingga kita bisa memikirkan alternatif yang terbaik jikalau nantinya kondisi bypass tak lagi ideal dengan volume yang melintas.

Pada tabel 5.6 dibawah ini menunjukan hasil perhitungan yang sudah dilakukan pada Bab 4 yakni, hasil forecasting volume lalu lintas pada tahun 2014 mendatang. Hasil ini didapat dari mengolah data yang didapat dari Dinas Bina Marga Jawa Timur.

**Tabel 5.6 . Tabel Rekapitulasi Hasil Forecasting Tahun 2014.**

| Jalur     | Arah         | LV   | LT  | MHV | LB  | MC   |
|-----------|--------------|------|-----|-----|-----|------|
| Bypass    | Surabaya (A) | 1306 | 274 | 354 | 158 | 1514 |
| Mojokerto | Jombang (B)  | 1426 | 326 | 443 | 176 | 2424 |

*Sumber: Hasil Perhitungan*

Dari data hasil forecasting diatas, lalu dihitung kembali nilai DS untuk masing-masing ruas karena data yang tersedia hanya satu, maka hasil pada tabel 5.6 dianggap melewati semua ruas yang ada di jalur bypass Mojokerto. Tabel 5.7 berikut akan menunjukkan hasil dari perhitungan program KAJI yang merupakan peramalan pada tahun 2014 dengan asumsi tak ada perubahan pola atau geometrik di jalur bypass itu sendiri.

**Tabel 5.7 . Tabel Rekapitulasi Hasil KAJI Tahun 2014.**

| Ruas                | Arah         | Volume | Kapasitas | DS    | TT(sec) |
|---------------------|--------------|--------|-----------|-------|---------|
| Mlirip-Sekarputih   | Surabaya (A) | 3296   | 3137      | 1,051 | -       |
|                     | Jombang (B)  | 4052   | 3137      | 1,292 | -       |
| Sekarputih-Terminal | Surabaya (A) | 3296   | 3137      | 1,051 | -       |
|                     | Jombang (B)  | 4052   | 3137      | 1,292 | -       |
| Terminal-Jampirogo  | Surabaya (A) | 3296   | 3137      | 1,051 | -       |
|                     | Jombang (B)  | 4052   | 3137      | 1,292 | -       |

*Sumber: Hasil Perhitungan*

Dari hasil KAJI pada tabel 5.7 kita dapat simpulkan bahwa bypass mojokerto mengalami kenaikan DS yang cukup signifikan hanya dalam waktu 5 tahun kedepan. Terbukti dengan DS yang tinggi yang mengindikasikan kondisi Lalu lintas tidak ideal bahkan bisa dibilang melebihi kapasitas.

Jika hal ini dibiarkan saja maka hal tersebut mungkin akan terjadi pada tahun mendatang. Kita harus mulai memikirkan alternatif perbaikan sehingga kita bisa mengurangi kemungkinan terjadinya penurunan kinerja bypass Mojokerto. Perbaikan yang bisa dilakukan untuk mencegah terjadinya overload volume di tahun mendatang adalah dengan cara melebarkan jalur eksisting, mengganti tipe jalur atau bisa juga dengan menambah median pada jalur bypass dan lain-lain.

Dalam Tugas akhir ini akan dicoba alternatif perbaikan yaitu mengubah tipe 2/2 UD menjadi 4/2 D. Selain itu lebar yang semula hanya 9 meter akan dilebarkan menjadi 12 meter serta menambahkan median 1 meter pada jalur bypass yang semula tidak ada. Hasil perhitungan dengan menggunakan alternatif diatas terdapat pada tabel 5.8 berikut ini.

**Tabel 5.8 . Hasil perhitungan dengan alternatif perbaikan tahun 2014**

| Ruas                | Arah         | Volume | Kapasitas | DS    | TT(sec) |
|---------------------|--------------|--------|-----------|-------|---------|
| Mlirip-Sekarputih   | Surabaya (A) | 2016   | 3216      | 0,627 | 155,53  |
|                     | Jombang (B)  | 2066   | 3216      | 0,642 | 156,83  |
| Sekarputih-Terminal | Surabaya (A) | 2016   | 3216      | 0,627 | 223,96  |
|                     | Jombang (B)  | 2066   | 3216      | 0,642 | 225,8   |
| Terminal-Jampirogo  | Surabaya (A) | 2016   | 3216      | 0,627 | 261,291 |
|                     | Jombang (B)  | 2066   | 3216      | 0,642 | 263,52  |

*Sumber: Hasil Perhitungan*

Dari hasil perhitungan kinerja dengan menggunakan kondisi alternatif seperti pada tabel 5.8 diatas, bisa ambil kesimpulan bahwa alternatif yang diberikan bisa mengurangi tingkat kepadatan kendaraan dari DS diatas 1 menjadi DS berkisar antara 0,62-0,64. Maka alternatif tersebut bisa untuk dipertahankan guna mengatasi masalah transportasi yang bisa saja terjadi dimasa mendatang sesuai dengan hasil peramalan yang telah dilakukan.

Hasil output dari program KAJI bisa dilihat pada Lampiran D (lampiran KAJI : Kondisi eksisting Tahun 2014 & KAJI : kondisi Perbaikan tahun 2014).

## BAB VI

# ANALISA BIAYA OPERASIONAL KENDARAAN DAN NILAI WAKTU

### 6.1 Biaya Operasional Kendaraan

Dari hasil analisa-analisa sebelumnya maka biaya operasional kendaraan sudah dapat dihitung. Yang dijadikan parameter dalam menghitung biaya operasional kendaraan adalah harga dari tiap komponen pada berbagai jenis kendaraan selain itu kecepatan juga termasuk didalamnya. Pada perhitungan BOK ini yang dapat dihitung hanya biaya dari Truk Besar, Truk kecil dan Mobil Penumpang, karena jenis kendaraan tersebut yang banyak melalui jalur yang ditinjau.

Dibawah ini adalah asumsi-asumsi yang dipakai untuk tiap kendaraan yang berlaku pada saat studi yaitu harga-harga untuk tahun 2009 adalah seperti pada tabel 6.

**Tabel 6.1. Nilai Komponen BOK Tahun 2009**

| Komponen        | Golongan I<br>Toyota Avanza<br>1,3E M/T Dress Up | Gol IIA<br>Mitsubishi FE 74<br>HD 125PS,6 Ban | Gol IIB<br>Mitsubishi FN 527<br>ML, 220 PS |
|-----------------|--|---|--|
| Harga Kendaraan | Rp. 134.600.000                                  | Rp. 213.000.000                               | Rp. 584.000.000                            |
| Bahan Bakar     | Rp. 4.500,-/liter                                | Rp. 4.500,-/liter                             | Rp. 4.500,-/liter                          |
| Olie Mesin      | Rp. 20.000,-/liter                               | Rp. 15.000,-/liter                            | Rp. 15.000,-/liter                         |
| Ban             | Rp. 432.000,-/buah                               | Rp. 880.000,-/buah                            | Rp. 1.048.000/buah                         |
| Mekanik         | Rp. 10.500,-/jam                                 | Rp. 10.500,-/jam                              | Rp. 10.500,-/jam                           |
| Suku Bunga      | 0,22% xharga baru                                | 0,22% xharga baru                             | 0,22% xharga baru                          |

*Sumber: Hasil Survey Lapangan*

### 6.1.1 Perhitungan BOK Per Kendaraan

Pada sub-bab ini akan dicari besarnya BOK tiap kendaraan per 1000 km dari bebagai macam kecepatan. Dengan memasukkan harga dari masing-masing item komponen dari tiap jenis kendaraan, dan dari persamaan Biaya Operasional Kendaraan seperti yang terdapat pada Bab II, dapat dicari biaya operasional dari tiap-tiap kecepatan. Berikut contoh perhitungan BOK untuk tahun 2009 pada kecepatan 10 km/jam.

- Kendaraan Penumpang (LV), Kecepatan = 10 km/jam

#### 1. Konsumsi bahan bakar

$$KBB = KBB \text{ dasar} \times (1 \pm (k_k + k_l + k_r))$$

$$KBB \text{ dasar kendaraan golongan I}$$

$$= 0,0284 V^2 - 3,0644 V + 141,68$$

$$Y = (((0,0284V^2) - (3,0644V) + (141,68)) \times 1,485)$$

X (Harga BBM)

$$Y = (((2,84) - (30,644)) + (141,68)) \times 1,485)$$

X (4500)

$$Y_1 = Rp\ 855.778,14 / 1000\ km$$

#### 2. Konsumsi Oli Mesin

Menurut tabel 2.25 yang terdapat pada Bab 2 Tugas Akhir ini maka jumlah konsumsi oli kendaraan golongan 1 pada kecepatan 10 km adalah :

$$Y = 0,0032 \times (\text{harga oli})$$

$$Y_2 = 0,0032 \times 20.000 \times 1000\text{km}$$

$$= Rp.\ 64.000,00 - / 1000\text{km}$$

#### 3. Biaya Pemakain Ban

Kendaraan golongan I :

$$Y_3 = (0,0008848 V - 0,0045333) \times$$

Harga Ban Baru

$$\begin{aligned} Y_3 &= (0,0008848 (10) - 0,0045333) \times (432.000) \\ &= \text{Rp. } 1.863,95 / 1000 \text{ km} \end{aligned}$$

#### 4. Biaya Montir

$$\begin{aligned} Y &= (0,00362 V + 0,36267) \times \text{upah motir} \\ &\quad \text{per jam} \\ Y &= (0,00362 (10) + 0,3267) \times 10,500.00 \\ Y_4 &= \text{Rp. } 4.188 / 1000 \text{ km} \end{aligned}$$

#### 5. Biaya Pemeliharaan Suku cadang

Golongan I:

$$\begin{aligned} Y_5 &= (0,0000064 V + 0,0005567) \times \\ &\quad \text{harga Kendaraan Baru} \\ &= (0,0000064(10) + 0,0005567) \times \\ &\quad 134.600.000 \\ &= \text{Rp. } 83.546,22 / 1000 \text{ km} \end{aligned}$$

#### 6. Biaya Penyusutan

$$\begin{aligned} Y_6 &= (1/(2,5 V + 125))x \\ &\quad \text{setengah harga Kendaraan Baru} \\ &= (1/(2,5 (10) + 125))x 134.600.000 \times 0,5 \\ &= \text{Rp. } 448.666,67 / 1000 \text{ km} \end{aligned}$$

#### 7. Bunga Modal

$$\begin{aligned} Y_7 &= 0,22\% (\text{harga kendaraan baru}). \\ &= 0,22\% \times (134.600.000) \\ &= \text{Rp. } 296.120 / 1000 \text{ km} \end{aligned}$$

#### 8. Biaya Asuransi

Golongan I :

$$\begin{aligned} Y_8 &= 38/(500V) \times \text{Harga Kendaraan} \\ &= 38 / (500 \times 10) \times \text{Rp. } 134.600.000 \\ &= \text{Rp. } 1.022.960,- / 1000 \text{ km} \end{aligned}$$

### 9. Biaya Overhead

Biaya over head jumlahnya 10% dari total diatas

$$\begin{aligned} Y_9 &= 10\% \times 2.777.123 \\ &= \text{Rp. } 277.712 \end{aligned}$$

Jadi besaran BOK untuk kendaraan penumpang pada kecepatan 10 km/jam pada tahun 2009 adalah :

$$\begin{aligned} Y_{\text{total}} &= Y_1 + Y_2 + Y_3 + Y_4 + Y_5 + Y_6 + Y_7 + Y_8 + Y_9 \\ &= \text{Rp. } 3.054.835,- / 1000\text{km} \end{aligned}$$

Sedangkan besarnya BOK untuk jenis kendaraan lain tiap-tiap kecepatan dapat dilihat pada tabel 6.2 berikut.

**Tabel 6.2 BOK tiap kendaraan tahun 2009**

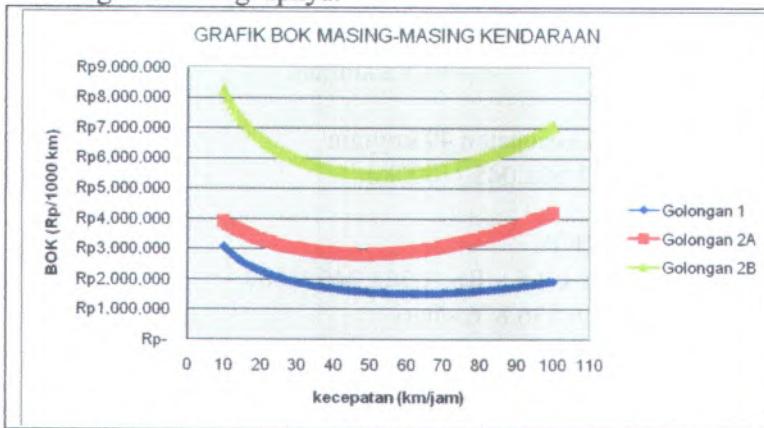

| Kec<br>(Km/ja<br>m) | Jenis Kendaraan     |                       |                        |
|---------------------|---------------------|-----------------------|------------------------|
|                     | Gol 1=<br>Rp/1000km | Gol 2A= Rp<br>/1000km | Gol 2B = Rp<br>/1000km |
| 10                  | Rp3,054,835         | Rp3,872,825           | Rp8,245,306            |
| 15                  | Rp2,551,522         | Rp3,524,087           | Rp7,234,260            |
| 20                  | Rp2,248,513         | Rp3,292,495           | Rp6,644,352            |
| 25                  | Rp2,040,999         | Rp3,117,952           | Rp6,240,084            |
| 30                  | Rp1,886,256         | Rp2,991,778           | Rp5,953,689            |
| 35                  | Rp1,763,189         | Rp2,897,639           | Rp5,743,136            |
| 40                  | Rp1,672,075         | Rp2,838,017           | Rp5,597,825            |

Sumber: Perhitungan

Sedangkan grafik BOK tiap kecepatan dari tabel diatas dapat dilihat pada gambar 6.1 dibawah ini dan pada Lampiran C untuk grafik selengkapnya.

Gambar 6.1 Grafik BOK tiap kecepatan tahun 2009

### 6.1.2 BOK TIAP KONDISI

Dari perhitungan BOK per kendaraan yang sudah dilakukan diatas untuk tiap-tiap kecepatan dapat diketahui besarnya BOK untuk masing-masing kendaraan tiap kecepatan dengan cara memasukkan besarnya kecepatan kendaraan yang melewati jalur bypass maupun jalur dalam kota dari hasil perhitungan. Sehingga dapat diketahui

besarnya BOK masing-masing jalur dengan persamaan dibawah ini.

$$\text{BOK perhari} = \text{BOK perkendaraan}/1000\text{km} \times \text{Panjang Jalan} \times \text{Jumlah Kendaraan}$$

Contoh perhitungan adalah sebagai berikut:

Bypass Mojokerto, ruas Mlirip-Sekar putih, Arah Jombang  
Jumlah Penduduk Mojokerto > 1 juta penduduk  $k = 8\%$

Volume MP/jam = 134 kendaraan/jam

Volume MP perhari = 134 / 8%  
= 1675 kendaraan/hari

Panjang Jalan = 2,5 km

Kecepatan = 48,98 km/jam

BOK MP pada kecepatan 49 km/jam

= Rp. 1.561.045 /1000km

Jadi besarnya BOK :

= 1675 x 2,5 x Rp. 1.561.045 /1000

= Rp. 6.536.876,-/hari

### 6.1.3 ANALISA PERBANDINGAN BOK

Dalam hal menentukan jalur perjalanan penting halnya untuk mengetahui berapakah besarnya biaya perjalanan yang digunakan untuk menempuh sebuah jalan. Maka dari itu dalam tugas akhir ini akan dibandingkan besarnya BOK antar jalur Bypass dan jalur dalam kota. Tabel 6.3 berikut menunjukkan besarnya kecepatan masing-masing tipe golongan kendaraan yang diperoleh dari hasil perhitungan KAJI berdasarkan data primer yang diperoleh melalui survei yang telah dilakukan.

**Tabel 6.3 Kecepatan Kendaraan Pada Jalur Bypass dan Jalur Dalam Kota**

| Jalur      | Ruas                     | Arah | L(km) | V kendaraan(km/jam) |        |        |
|------------|--------------------------|------|-------|---------------------|--------|--------|
|            |                          |      |       | Gol 1               | Gol 2A | Gol 2B |
| By Pass    | Mlirip-Sekarputih        | A    | 2,5   | 49,59               | 44,42  | 43,13  |
|            |                          | B    | 2,5   | 48,98               | 43,94  | 42,68  |

|            |                          | B    | 2,7       | Rp 14,311,551 | Rp 1,087,782 | Rp 3,534,354  |
|            | Jl. RA Basuni pengadilan | A    | 1,1       | Rp 4,337,802  | Rp 200,283   | Rp 799,957    |
|            |                          | B    | 1,1       | Rp 5,679,884  | Rp 478,110   | Rp 1,599,913  |
| Dalam Kota | Jl. Raden Wijaya         | A    | 1,4       | Rp 7,171,981  | Rp 1,096,316 | Rp 494,310    |
|            |                          | B    | 1,4       | Rp 11,605,056 | Rp 900,363   | Rp 1,186,343  |
|            | Jl. Gajah Mada Pahlawan  | A    | 1,5       | Rp 5,963,348  | Rp 3,605,654 | Rp 3,030,648  |
|            |                          | B    | 1,5       | Rp 6,383,386  | Rp 1,929,350 | Rp 2,965,857  |
|            | Jl. Gajah Mada Walikota  | A    | 0,5       | Rp 2,007,660  | Rp 1,194,055 | Rp 975,381    |
|            |                          | B    | 0,5       | Rp 2,016,868  | Rp 532,128   | Rp 1,129,850  |
|            | Jl. Gajah Mada koramil   | A    | 1,1       | Rp 4,263,793  | Rp 2,317,872 | Rp 2,605,661  |
|            |                          | B    | 1,1       | Rp 4,259,624  | Rp 1,244,304 | Rp 1,864,253  |
|            | Jl. Raya Padangan        | A    | 2,9       | Rp 42,708,067 | Rp 537,887   | Rp 1,497,965  |
|            |                          | B    | 2,9       | Rp 42,118,538 | Rp 860,619   | Rp 2,139,951  |

*Sumber : Hasil Perhitungan*

Total BOK Jalur Bypass adalah

Golongan 1 : Rp 85,040,248

Golongan 2A : Rp 33,045,308

Golongan 2B : Rp 165,548,444

Jumlah = Rp 283,634,000 /hari

Sedangkan untuk jalur Kota adalah

Golongan 1 : Rp 162,886,580

Golongan 2A : Rp 16,574,649

Golongan 2B : Rp 25,198,915

Jumlah = Rp 204,660,144 /hari

Jadi selisih biaya operasional kendaraan yang melewati jalur bypass dan jalur dalam kota adalah sebesar :

$$\text{Selisih} = \text{Rp } 204,660,144 - \text{Rp } 283,634,000$$

$$= \text{Rp } -(78,973,856),-/hari$$

$$= \text{Rp } -(28,825,457,558),-/Tahun$$

Dari hasil diatas maka kita bisa mengetahui adanya perbedaan biaya yang harus dikeluarkan oleh pengguna kendaraan jika melalui jalur bypass dan jalur kota. Tanda negative diatas menunjukkan bahwa seharusnya bypass dibuat untuk mengurangi besarnya biaya perjalanan jika melalui jalur kota, namun karena semakin bertambahnya kendaraan yang ada maka kinerja bypass yang semula bisa mengurangi biaya operasional kendaraan yang lewat kota, sekarang menurut hasil perhitungan diatas melebihi biaya operasional jika pengguna kendaraan melalui jalur dalam kota. Hal ini mengindikasikan kinerja bypass menurun jika dibandingkan dengan saat awal dibuatnya dulu.

## 6.2 NILAI WAKTU PERJALANAN

Setelah selesai mengitung besarnya nilai BOK pada tahun 2009, maka selanjutnya akan dihitung besarnya nilai waktu perjalanan (dalam rupiah) untuk kedua jalur tersebut. Nilai waktu ini sangat tergantung dari berapa waktu yang dibutuhkan untuk menempuh sebuah jalur yang biasa disebut

travel time. Berikut adalah daftar waktu tempuh untuk masing-masing jalur dan masing-masing ruas yang ditunjukkan pada tabel 6.5 berikut.

**Tabel 6.5 Waktu Perjalanan Kendaraan Jalur Bypass dan Jalur dalam Kota**

| Jalur      | Ruas                     | Arah | L<br>(km) | Travel Time (jam) |        |        |
|------------|--------------------------|------|-----------|-------------------|--------|--------|
|            |                          |      |           | Gol 1             | Gol 2A | Gol 2B |
| By Pass    | Mlirip-Sekarputih        | A    | 2,5       | 0.05              | 0.06   | 0.06   |
|            |                          | B    | 2,5       | 0.05              | 0.06   | 0.06   |
|            | Sekarputih-Terminal      | A    | 3,6       | 0.07              | 0.08   | 0.08   |
|            |                          | B    | 3,6       | 0.07              | 0.08   | 0.08   |
|            | Terminal-Jampirogo       | A    | 4,2       | 0.08              | 0.09   | 0.09   |
|            |                          | B    | 4,2       | 0.08              | 0.09   | 0.09   |
| Dalam Kota | Jl. RA Basuni sooko      | A    | 2.7       | 0.08              | 0.08   | 0.08   |
|            |                          | B    | 2.7       | 0.07              | 0.08   | 0.08   |

|            |                          | B    | 1.5       | 0.03              | 0.04   | 0.04   |
|            | Jl. Gajah Mada Walikota  | A    | 0.5       | 0.01              | 0.01   | 0.01   |
|            |                          | B    | 0.5       | 0.01              | 0.01   | 0.01   |
|            | Jl. Gajah Mada koramil   | A    | 1.1       | 0.02              | 0.03   | 0.03   |
|            |                          | B    | 1.1       | 0.03              | 0.03   | 0.03   |
|            | Jl. Raya Padangan        | A    | 2.9       | 0.09              | 0.09   | 0.09   |
|            |                          | B    | 2.9       | 0.09              | 0.10   | 0.09   |

*Sumber: Perhitungan*

Dari tabel diatas dapat disimpulkan bahwa nilai waktu akan berbeda-beda sesuai jenis kendaraan dan daerahnya. Hal

ini bisa disebabkan karena adanya perbedaan karakteristik penduduknya, misalnya dalam hal pendapatan. Karena hal ini akan berpengaruh pada berbedanya pendapatan perkapita tiap daerah yang bisa menentukan besarnya nilai waktu perjalanan.

Dalam perhitungan ini akan dipakai besaran nilai waktu menurut standar dari PT Jasa Marga tahun 1996 yang besar nilainya adalah sebagai berikut:

|          |     |                   |
|----------|-----|-------------------|
| Golongan | I   | : Rp. 12.287 /jam |
| Golongan | IIA | : Rp. 18.534 /jam |
| Golongan | IIB | : Rp. 12.287 /jam |

Sumber : Perencanaan dan Permodelan Transportasi,2000

Karena nilai diatas adalah untuk daerah Jakarta maka harus dikoreksi ke daerah Jatim dengan faktor koreksi sebesar 0,25.

Jadi nilai waktu untuk daerah Jatim adalah :

|          |     |                 |
|----------|-----|-----------------|
| Golongan | I   | : Rp. 3071 /jam |
| Golongan | IIA | : Rp. 4634 /jam |
| Golongan | IIB | : Rp. 3442 /jam |

Dengan asumsi bahwa tiap tahun nilai waktu mengalami kenaikan sejalan dengan besarnya pertumbuhan ekonomi maka besarnya nilai waktu di tahun 2009 atau kondisi eksisting adalah seperti ditunjukkan pada tabel 6.6.

**Tabel 6.6 Nilai Waktu Masing-masing Kendaraan tiap tahun**

| Tahun | Pertumbuhan (%) | Nilai Waktu (Rupiah) |        |        |
|-------|-----------------|----------------------|--------|--------|
|       |                 | Gol 1                | Gol 2A | Gol 2B |
| 1996  | 3.0792          | 3071                 | 4634   | 3442   |
| 1997  | 3.4788          | 3178                 | 4795   | 3562   |
| 1998  | 3.8784          | 3301                 | 4981   | 3700   |
| 1999  | 4.278           | 3442                 | 5194   | 3858   |
| 2000  | 4.808           | 3608                 | 5443   | 4044   |
| 2001  | 4.78            | 3780                 | 5704   | 4237   |
| 2002  | 5.68            | 3995                 | 6028   | 4478   |
| 2003  | 5.84            | 4228                 | 6380   | 4739   |
| 2004  | 5.8             | 4474                 | 6750   | 5014   |

*Lanjutan tabel 6.6*

|      |       |      |      |      |
|------|-------|------|------|------|
| 2005 | 6.11  | 4747 | 7162 | 5320 |
| 2006 | 6.476 | 5054 | 7626 | 5665 |
| 2007 | 6.754 | 5396 | 8141 | 6047 |
| 2008 | 7.032 | 5775 | 8713 | 6473 |
| 2009 | 7.31  | 6197 | 9350 | 6946 |

Sumber: BPS & Perhitungan

Jadi di tahun 2009 ini jika menurut nilai waktu Jasa Marga yang sudah di kalikan dengan pertumbuhan ekonomi pertahunnya adalah sebagai berikut:

Golongan I : Rp. **6.917** / jam  
 Golongan IIA : Rp. **9.350** / jam  
 Golongan IIB : Rp. **6.946** / jam

Untuk mengetahui berapakah besarnya nilai waktu perjalanan yang didapat jika melalui jalur bypass dan jalur dalam kota adalah bisa dilihat pada tabel 6.7 berikut.

**Tabel 6.7 Nilai Waktu Masing-masing Kendaraan Tahun 2009**

| Jalur      | Ruas                        | Arah | Nilai Waktu (Rupiah/kend/jam) |        |        |
|------------|-----------------------------|------|-------------------------------|--------|--------|
|            |                             |      | Gol 1                         | Gol 2A | Gol 2B |
| By Pass    | Mlirip-Sekarputih           | A    | 310                           | 561    | 417    |

*Sumber: Perhitungan*

Dari tabel 6.8 diatas dapat diketahui bahwa ada perbedaan antara jalur bypass dan jalur dalam kota, Bisa dilihat pada tabel 6.9 dibawah ini :

**Tabel 6.9 Perbandingan Nilai Waktu Masing-masing Jalur/tahun**

| Jalur    | Arah                 | Gol 1(Rp)        | Gol 2A(Rp)     | Gol 2B(Rp)       | Total               |
|----------|----------------------|------------------|----------------|------------------|---------------------|
| by pass  | Surabaya-Jombang (B) | 1,353,871,721.17 | 573,360,549.51 | 798,771,724.21   | Rp 5,377,577,752.90 |
|          | Jombang-Surabaya (A) | 1,221,470,365.50 | 389,976,183.28 | 1,040,127,209.22 |                     |
| Dlm Kota | Surabaya-Jombang (B) | 3,306,324,241.33 | 238,900,454.10 | 193,441,137.99   | Rp 7,103,970,970.67 |
|          | Jombang-Surabaya (A) | 2,927,458,958.83 | 299,472,694.73 | 138,373,460.69   |                     |

*Sumber: Perhitungan*

Jadi bisa disimpulkan bahwa biaya perjalanan menurut waktu perjalanan lebih murah jika melalui jalur bypass dari pada melalui jalur dalam kota yaitu selisih sekitar Rp 2 miliar untuk golongan kendaraan 1 tiap tahunnya, Namun ini tidak bisa dijadikan acuan bahwa kinerja Bypass masih baik, karena Golongan Kendaraan 2A dalam kasus tertentu yaitu pada arah Surabaya-Jombang nilai waktu perjalannya dalam setahun lebih mahal dari pada jalur dalam kota, bahkan untuk tipe golongan 2B untuk masing-masing arah keduanya jauh lebih mahal dari pada jalur dalam kota. Perlu diingat juga dalam perhitungan BOK pada sub bab sebelumnya justru jalur dalam kota lebih murah dari pada jalur Bypass, Oleh karena itu perlu dilakukan peninjauan kembali dari aspek yang lain untuk bisa mengetahui seberapa besarnya kinerja bypass saat ini guna mendapatkan pelayanan yang terbaik dari sebuah jalan.

### **6.3 BIAYA PERJALANAN MASING-MASING KENDARAAN**

Biaya perjalanan bisa diperoleh dari nilai Biaya Operasional yang ditambahkan dengan Nilai Waktu yang sudah dihitung pada sub bab diatas. Berikut adalah nilai Biaya

Operasional Kendaraan untuk masing-masing golongan kendaraan pada tabel 6.10 dan tabel 6.11.

**Tabel 6.10 BOK tiap Kendaraan**

| Jalur      | Ruas                     | Ara<br>h | L<br>(km<br>) | BOK /kendaraan(Rp) |           |           |
|------------|--------------------------|----------|---------------|--------------------|-----------|-----------|

*Sumber : Perhitungan*

Nilai waktu untuk masing-masing kendaraan yang tidak dikalikan dengan jumlah kendaraan adalah seperti pada tabel 6.11 diatas dan tabel 6.12 berikut ini menunjukkan total nilai waktu masing-masing kendaraan per arah.

**Tabel 6.12 Nilai Waktu Tiap Kendaraan per Arah**

| Jalur       | Arah                 | Gol 1(Rp)   | Gol 2A(Rp)  | Gol 2B(Rp)  |
|-------------|----------------------|-------------|-------------|-------------|
| by pass     | Surabaya-Jombang (B) | Rp 1,239.44 | Rp 2,150.57 | Rp 1,597.55 |
|             | Jombang-Surabaya (A) | Rp 1,239.44 | Rp 2,150.57 | Rp 1,597.55 |
| Dlm<br>Kota | Surabaya-Jombang (B) | Rp 1,834.67 | Rp 2,980.97 | Rp 2,272.00 |
|             | Jombang-Surabaya (A) | Rp 1,811.72 | Rp 2,932.57 | Rp 2,242.17 |

*Sumber : Perhitungan*

Jadi dari hasil diatas bisa diperoleh besaran biaya perjalanan yaitu dengan menambahkan nilai BOK dengan Nilai waktu untuk masing-masing kendaraan dan tiap arah, seperti pada tabel 6.13 berikut ini.

**Tabel 6.13 Biaya Perjalanan Tiap Kendaraan**

| Jalur       | Arah                 | Gol 1(Rp) | Gol 2A(Rp) | Gol 2B(Rp) |
|-------------|----------------------|-----------|------------|------------|
| by pass     | Surabaya-Jombang (B) | Rp 17,121 | Rp 31,020  | Rp 58,357  |
|             | Jombang-Surabaya (A) | Rp 17,166 | Rp 31,036  | Rp 58,411  |
| Dlm<br>Kota | Surabaya-Jombang (B) | Rp 20,887 | Rp 35,381  | Rp 66,687  |
|             | Jombang-Surabaya (A) | Rp 20,884 | Rp 35,456  | Rp 66,891  |

Sumber : Perhitungan

Jika ditinjau dari tiap kendaraan biaya perjalanan melalui jalur kota sedikit lebih murah dari pada jalur bypass karena jarak tempuh yang lebih pendek dan waktu yang singkat.

## BAB VII

### KESIMPULAN DAN SARAN

#### 7.1. KESIMPULAN

Setelah dilakukan perhitungan dan analisa data baik data primer maupun sekunder yang dibantu dengan program KAJI dan Excel maka didapat sebuah kesimpulan untuk masing-masing permasalahan yang diangkat dalam tugas akhir ini. Berikut adalah kesimpulan yang diperoleh untuk tiap permasalahan :

1. Hasil yang didapat dari KAJI dan juga dari hasil pengamatan adalah untuk arah Surabaya melalui jalur By pass dari pengamatan adalah 855 detik dan 457 detik dari hasil perhitungan, jika melalui jalur Kota waktunya 1017 detik menurut pengamatan dan 802 detik menurut perhitungan. Sedangkan untuk arah Jombang melalui jalur By pass dari pengamatan adalah 842 detik dan 457 detik dari hasil perhitungan, jika melalui jalur Kota waktunya 1012 detik menurut pengamatan dan 817 detik menurut perhitungan. Hal ini menunjukkan terjadi hambatan yang cukup berpengaruh pada jalur by pass sehingga mempengaruhi laju perjalanan dan menambah lama waktu tempuhnya. Sedangkan untuk jalur dalam kota tidak terjadi perbedaan yang mencolok antara hasil dari perhitungan dan hasil dari pengamatan langsung dilapangan.
2. Besaran nilai biaya operasional (BOK) yang didapat dari perhitungan pada BAB 6 adalah Pada Jalur By pass Arah Surabaya Golongan 1 Rp Rp 17,166. Golongan 2A Rp 31,036, dan Golongan 2B Rp 58,411. Jalur By pass Arah Jombang Golongan 1 Rp

17,121, Golongan 2A Rp 31,020, dan Golongan 2B Rp 58,357. Jalur Dalam Kota Arah Surabaya Golongan 1 Rp 20,884, Golongan 2A Rp 35,456, dan Golongan 2B Rp 66,891. Jalur Dalam Kota Arah Jombang Golongan 1 Rp 20,887, Golongan 2A Rp 35,381, dan Golongan 2B Rp 66,687.

3. Hasil dari perhitungan peramalan volume kendaraan yang melintas jalur by pass pada tahun 2014 adalah sebagai berikut , Arah Surabaya  $LV = 1306$  kendaraan,  $LT = 274$  kendaraan,  $MHV = 354$  kendaraan,  $LV = 158$  kendaraan,  $LT = 1514$  kendaraan, untuk Arah Jombang  $LV = 426$  kendaraan,  $LT = 326$  kendaraan,  $MHV = 443$  kendaraan,  $LV = 176$  kendaraan,  $LT = 2424$  kend. Dari hasil peramalan diatas kemudian didapat hasil perhitungan dari KAJI yaitu untuk arah Surabaya Volume = 3206, C = 3137, DS= 1,051. Sedangkan untuk arah Jombang Volume = 4052, C = 3137, DS= 1,292.
4. Diberikan satu alternatif perbaikan kinerja by pass yang bisa mengatasi masalah lalu lintas pada tahun 2014. Alternatif perbaikan yaitu mengubah tipe 2/2 UD menjadi 4/2 D. Selain itu lebar yang semula hanya 9 meter akan dilebarkan menjadi 12 meter serta menambahkan median 1 meter pada jalur bypass yang semula tidak ada. Hasil perhitungan dengan menggunakan alternatif adalah untuk arah Surabaya Volume = 2016, C = 3216, DS= 0,627. Sedangkan untuk arah Jombang Volume = 2066, C = 3216, DS= 0,642. Dari hasil perhitungan kinerja dengan menggunakan kondisi alternatif bisa ambil kesimpulan bahwa alternatif yang diberikan bisa mengurangi tingkat kepadatan kendaraan dari DS diatas 1 menjadi DS berkisar antara 0,62-0,64. Maka

alternatif tersebut bisa untuk dipertahankan guna mengatasi masalah transportasi yang bisa saja terjadi dimasa mendatang sesuai dengan hasil peramalan yang telah dilakukan.

## 7.2. SARAN

Saran untuk pengerjaan Tugas Akhir selanjutnya adalah:

1. Kinerja by pass harus ditingkatkan lagi untuk mengantisipasi meningkatnya volume lalu lintas yang akan datang.
2. Alternatif yang diberikan perlu dicari lagi variasi yang lain karena akan lebih memberikan banyak pilihan untuk meningkatkan kinerja by pass Mojokerto.
3. Perlu dilakukan studi lebih lanjut tentang kinerja by pass Mojokerto sendiri dengan memperhitungkan pengaruh dari persimpangan yang ada.

SIDE FRICTION CLASS: If detailed data are available, use first table to determine weighted frequency of events and then use second table. If no detailed data, use second table only.

1. Determination of frequency of events

|              |                        |        |           |             |           |
|--------------|------------------------|--------|-----------|-------------|-----------|
| Calculation  | Side friction          | Symbol | Weighting | Frequency   | Weighted  |
| of weighted  | type of events         |        | factor    | of events   | frequency |
| frequency    | (30)                   | (21)   | (22)      | (23)        | (24)      |
| of events    |                        |        |           |             |           |
| per hour     | Pedestrians            | PRD    | 0.5       | NA / h,200m | NA        |
| and 200 m.   | Parking, stopping veh. | PSV    | 1.0       | NA / h,200m | NA        |
|              | Entry+exit of vehicles | EEV    | 0.7       | NA / h,200m | NA        |
| Frequencies  | Slow-moving vehicles   | SMV    | 0.4       | NA / h      | NA        |
| are for      |                        |        |           | Total:      | NA        |
| both sides   |                        |        |           |             |           |
| of the road. |                        |        |           |             |           |

2. Determination of side friction class

|   |   |               |
|---|---|---------------|
| Weighted frequency  | Typical conditions                                      | Side fri-     |
| of events (30)  |   | ction class   |
| < 100   | Residential area, very few activities                   | V= very low   |
| 100 - 299   | Residential area, some public transports etc.           | L= low        |
| 300 - 499   | Industrial area, some small shops                       | M= medium     |
| 500 - 893   | Commercial, high roadside activity                      | H= high       |
| > 900   | Commercial area with very high roadside market activity | VH= very high |
| For current case indicate side friction class: M ( L is default ) |   |               |

SIDE FRICTION CLASS: If detailed data are available, use first table to determine weighted frequency of events and then use second table. If no detailed data, use second table only.

1. Determination of frequency of events

| Calculation  | Side friction          | Symbol | Weighting | Frequency    | Weighted frequency |
|--------------|------------------------|--------|-----------|--------------|--------------------|
| of weighted  | type of events         |        | factor    | of events    | frequency          |
| frequency    | (20)                   | (21)   | (22)      | (23)         | (24)               |
| of events    |                        |        |           |              |                    |
| per hour     | Pedestrians            | PED    | 0.5       | NA / h, 200m | NA                 |
| and 200 m.   | Parking, stopping veh. | PSV    | 1.0       | NA / h, 200m | NA                 |
|              | Entry-exit of vehicles | EEV    | 0.7       | NA / h, 200m | NA                 |
| Frequencies  | Slow-moving vehicles   | SMV    | 0.4       | NA / h       | NA                 |
| are for      | both sides             |        |           | Total:       | NA                 |
| of the road. |                        |        |           |              |                    |

2. Determination of side friction class

| Weighted frequency | Typical conditions                                      | Side friction class |
|--------------------|---|---------------------|
| of events (30)     |   |                     |
| < 100              | Residential area, very few activities                   | VL very low         |
| 100 - 299          | Residential area, some public transports etc.           | L= low              |
| 300 - 499          | Industrial area, some roadside shops                    | M= medium           |
| 500 - 899          | Commercial, high roadside activity                      | H= high             |
| > 900              | Commercial area with very high roadside market activity | VH= very high       |

For current case indicate side friction class: M (L is default)

 SIDE FRICTION CLASS:  
 If detailed data are available, use first table to determine  
 weighted frequency of events and then use second table.  
 If no detailed data, use second table only.  
  
 1. Determination of frequency of events  
 Calculation | Side friction | Symbol: Weighting | Frequency | Weighted  
 of weighted | type of events | factor | of events | frequency  
 frequency | (20) | (21) | (22) | (23) | (24)  
 of events |  
 per hour | Pedestrians | PED | 0.5 | NA / h,200m | NA |  
 and 200 m. | Parking, stopping veh. | PSV | 1.0 | NA / h,200m | NA |  
 | Entry-exit of vehicles | EVV | 0.7 | NA / h,200m | NA |  
 Frequencies | Slow-moving vehicles | SMV | 0.4 | NA / h | NA |  
 are for  
 both sides | | | | | Total: | NA |  
 of the road. |  
  
 2. Determination of side friction class  
 Weighted frequency | Typical conditions | Side fric-  
 of events (30) | | tion class |  
 | < 100 | Residential area, very few activities! Vh very low |  
 | 100 - 299 | Residential area, some public | Lv low  
 | | transports etc. |  
 | 300 - 499 | Industrial area, some roadside shops | Hv medium |  
 | 500 - 699 | Commercial, high roadside activity | Hh high |  
 | > 900 | Commercial areas with very high | VHh very high |  
 | | | | |  
 | For current case indicate side friction class: N ( L is default ) |

| SIDE FRICTION CLASS: If detailed data are available, use first table to determine |
| | weighted frequency of events and then use second table. |
| | If no detailed data, use second table only. |
| . . . . . |
| 1. Determination of frequency of events |
| . . . . . |
| Calculation | Side friction | Symbol | Weighting | Frequency | Weighted |
| of weighted | type of events | factor | of events | frequency |
| frequency | (20) | (21) | (22) | (23) | (24) |
| of events | | | | | |
| per hour | Pedestrians | PED | 0.5 | NA / h.250m | NA |
| and 200 m. | Parking, stopping veh. | PCV | 1.0 | NA / h.250m | NA |
| Frequencies | Entry-exit of vehicles | EEV | 0.7 | NA / h.250m | NA |
| are for | Slow-moving vehicles | SMV | 0.4 | NA / h | NA |
| both sides | | | | | |
| of the road. | | | | Total: | NA |
| . . . . . |
| 2. Determination of side friction class |
| . . . . . |
| |Weighted frequency| Typical conditions | Side fric- |
| | of events (20) | | | tion class |
| | | | | |
| | < 100 | Residential area, very few activities! VL= very low |
| | 100 - 299 | Residential area, some public | L= low |
| | | | transports etc. |
| | 300 - 499 | Industrial area, some roadside shops | M= medium |
| | 500 - 999 | Commercial, high roadside activity | H= high |
| | > 900 | Commercial area with very high | VH= very high |
| | | | roadside market activity | |
| | | | |
| | For current case indicate side friction class: VH ( L is default ) |

**SIDE FRICTION CLASS**: If detailed data are available, use first table to determine weighted frequency of events and then use second table. If no detailed data, use second table only.

1. Determination of frequency of events

| Calculation                    | Side friction          | Symbol | Weighting | Frequency   | Weighted frequency |
|--------------------------------|------------------------|--------|-----------|-------------|--------------------|
| of weighted frequency          | type of events         | I      | N-factor  | I of events | I frequency        |
| of events                      | (20)                   | (21)   | (22)      | (23)        | (24)               |
| per hour and 200 m.            | Pedestrians            | PED    | 0.5       | NA / h,200m | NA                 |
| Frequencies are for both sides | Parking, stopping veh. | PPV    | 1.0       | NA / h,200m | NA                 |
| are for both sides             | Entry-exit of vehicles | EV     | 0.1       | NA / h,200m | NA                 |
| of the road.                   | Slow-moving vehicles   | SMV    | 0.4       | NA / h      | NA                 |
|                                |                        |        |           | Total:      | NA                 |

2. Determination of side friction class

| Weighted frequency | Typical conditions  | Side friction class |
|--------------------|---|---------------------|
| I of events (35)   |   |                     |
| < 100              | Residential area, very few activities                       | VL= very low        |
| 100 - 299          | Residential area, some public transport, some shopping etc. | Lo = low            |
| 300 - 499          | Industrial area, some roadside shops                        | M= medium           |
| 500 - 899          | Commercial, high roadside activity                          | H= high             |
| > 900              | Commercial area with very high traffic volume               | VH= very high       |
|                    | roadside market activity                                    |                     |
|                    | For current case indicate side friction class:              | VH (L is default)   |

 SIDE FRICTION CLASS: If detailed data are available, use first table to determine weighted frequency  
 of events and then go to second table. If not, use second table only.  
 1. Determination of frequency of events  
 Calculation of weighted | Side friction | Symbol| Weighting| Frequency | Weighted |  
 frequency of events per | type of events | factor | of events | frequency |  
 hour and 200 m of the | (20) | (21) | (22) | (23) | (24) |  
 studied road segment.  
 Pedestrians | PED | 0.6 | NA / h,200m | NA |  
 Frequencies are for | Parking, stopping vehl | PSV | 0.5 | NA / h,200m | NA |  
 both sides of the road. | Entry-exit of vehicles | EVV | 1.0 | NA / h,200m | NA |  
 Slow-moving vehicles | SMV | 0.4 | NA / h | NA |  
 Total: | | | NA |  
 2. Determination of side friction class  
 Weighted frequency | Typical conditions | Side friction |  
 of events (30) | | class |  
 < 50 | Rural, agriculture or undeveloped | VI= very low |  
 50 - 149 | Rural, some roadside buildings | I= low |  
 | and some activities | |  
 150 - 249 | Village, residential activities | II= medium |  
 250 - 349 | Village, some market activities | III= high |  
 > 350 | Almost urban, market and business | VII= very high |  
 For current case indicate side friction class: M (1 is default)

K.A. : | Previous JAHN, THOMAS Date 27 August 2000  
 INTER-ROAD ROAD Segment number 100  
 Segment code 100-1 to 100-3 Checked by 1

Form 2B-11 Input Segment between JAHN, THOMAS and TERRITORIAL RESULTATE

ROAD GEOMETRY : Administer, road class 1 provincial, Functional road class 1  
 Road type 4720, Length (m) 4.000

Purpose : Operation, Time period 2000, Case number 100-7801

traffic flow data for whole segment analysis:

**IDE FRICTION CLASS:** If detailed data are available, use first table to determine weighted frequency

#### Determination of frequency of events

| calculation of weighted frequency of events per hour and 200 m of the studied road segment. | Side friction type of events (20) | Symbol (21) | Weighting factor (22) | Frequency of events (23) | Weighted frequency (24) |
|---|-----------------------------------|-------------|-----------------------|--------------------------|-------------------------|
| Percentages are for both sides of the road.   | Pedestrians                       | PED         | 0.6                   | NA / h,200m              | NA                      |
|   | Parking, stopping veh.            | PSV         | 0.8                   | NA / h,200m              | NA                      |
|   | Entry+exit of vehicles            | EEV         | 1.0                   | NA / h,200m              | NA                      |
|   | Slow-moving vehicles              | SMV         | 0.4                   | NA / h                   | NA                      |
|   |                                   |             |                       | Total:                   | NA                      |

### 3. Determination of side friction class

| Weighted frequency<br>of events (30) | Typical conditions  | Side friction<br>class |
|--------------------------------------|---|------------------------|
| < 50                                 | Rural, agriculture or undeveloped<br>with very few activities | Vf= very low           |
| 50 - 149                             | Rural, some roadside buildings<br>and some activities         | L= low                 |
| 150 - 249                            | Village, residential activities                               | M= medium              |
| 250 - 349                            | Village, some market activities                               | H= high                |
| > 350                                | Almost urban, market and business<br>activities               | VH= very high          |

```
+-----+  
| For current case indicate side friction class: M ( L is default) |  
+-----+
```

## BIODATA PENULIS

Penulis dilahirkan di Mojokerto, 24 April 1987, merupakan anak pertama dari 2 bersaudara. Penulis telah menempuh pendidikan formal, yaitu di SDN Simongagrok 2, SMPN 2 Dawarbandong, dan SMAN 1 Sooko Mojokerto. Setelah lulus dari SMAN, penulis mengikuti SPMB dan diterima di Jurusan Teknik Sipil FTSP-ITS pada tahun 2005 dan terdaftar dengan NRP.3105100139.

Di Jurusan Teknik Sipil ini, penulis mengambil bidang studi perhubungan jalan raya. Penulis saat ini juga aktif di kepengurusan Purna Paskibraka Indonesia Kabupaten Mojokerto sebagai sekretaris periode 2009-2014. Selain itu Penulis juga pernah aktif di beberapa Organisasi yang ada di ITS yakni Badan Eksekutif Mahasiswa (BEM) dan tentunya juga Himpunan Mahasiswa Teknik Sipil (HMS). Selama kuliah di ITS, penulis kerap mengikuti kegiatan yang diadakan kampus. Dan penulis mendapatkan gelar sarjana tepat empat tahun kuliah di ITS di tahun 2009.
